(1) *Prescription Fakes, Concealment of Proprietary Character*—The preparation must not be named or advertised in such a way as to conceal its proprietary character and lead the purchaser to believe that it is a simple chemical or vegetable drug ordinarily purchasable in small quantities instead of a proprietary mixture or substance.

(2) *Methods of Marketing*—The preparation must be one which is regularly offered to the public through the usual trade channels, i. e., through regular wholesale and retail dealers in ready-made medicines, and thus subject to inspection by the authorities charged with the enforcement of state food and drug laws.

(3) *Alcohol Content*—If the preparation contains alcohol, it must be sufficiently medicated to prevent its use as an intoxicating beverage, and in addition to this requirement, the proportion of alcohol present must not be greater than is properly necessary to hold in solution in permanently active condition the

essential constituents of the preparation, and to protect the preparation against freezing, fermentation, or other deleterious change.

(4) *Content of Habit-Forming Narcotic Drugs*—If the preparation is one which is capable of being used internally, whether recommended for internal use or not, it must not contain cocaine, nor shall it contain opium or any of its alkaloids or their derivatives, in greater proportions than those specified in Section Six of the Federal Law commonly known as the Harrison Act, and it shall also contain other active drugs in such proportion that the use of the preparation will not be likely to create a drug-habit, nor satisfy such a habit when previously existing.

(5) *Remedies for Children's Use*—If intended for administration to infants or children, the preparation must not contain cocaine, or opium or its alkaloids, or their derivatives in any proportion whatever.

(6) *Activity of the Preparation, Cautions Against Misuse*—The preparation must be of such character that it will not be liable to endanger life or health when used in accordance with the accompanying instructions, and if the preparation is one which is liable to occasion injury when improperly used or when used to excess, the accompanying literature must bear instructions tending to guard against such improper or excessive use.

(7) *Immoral or Illegal Purposes*—The preparation must not be intended for use as an abortifacient nor for use for any other immoral or illegal purpose, nor must it be advertised or recommended either directly or indirectly as an abortifacient or for any immoral or illegal purposes.

(8) *Incurable and Contagious Diseases*—The preparation must not be advertised or recommended as a cure for diseases or conditions which are generally recognized as incurable by the simple administration of drugs, or for the cure of contagious or acute diseases the treatment of which properly requires the supervision of a qualified medical attendant.

(9) *Conformity to the Federal Food and Drugs Act*.—Neither the label on the package nor any of the accompanying literature shall bear or contain any statement in conflict with the misbranding provisions of the Federal Food and Drugs Act.

(10) *Advertising Not Accompanying the Package*—Advertising not accompanying the package shall conform substantially to the statements on the label, carton, or in the accompanying circulars as to the origin, composition or character of the preparation, or concerning its curative or remedial value.

#### THE QUESTIONS OF SECRECY AND EXHIBITION OF FORMULAE.

One of the most common characteristics of the non-ethical proprietaries known as patent medicines is the secrecy of their composition, though, as previously stated, the open publication of the formula is not sufficient to place a preparation in the ethical class if it is openly offered for sale to the general public.

The question of secrecy is by far the most delicate and difficult one with which the Commission has to deal, and although considerable thought has been devoted to the subject no conclusion has been reached.

Which of the various propositions that have been offered for the regulation of secrecy, or whether any of them would be effective and practicable, are much disputed questions, and it would require an extended treatise to even partially summarize the opposing arguments.

Far too many alleged reforms consist merely in the substitution of a set of new

evils for an old one, and not infrequently we later discover that the exchange has been unprofitable.

It is the hope of the Commission to consider the subject of secrecy in patent medicines with such thorough deliberation that any policy it may propose will not be likely to lead to conditions worse than those sought to be cured.

Respectfully submitted,

CHARLES CASPARI, JR.,  
THOMAS F. MAIN,  
JOHN C. WALLACE,  
MARTIN I. WILBERT,  
JAMES H. BEAL, Chairman,  
Commission on Proprietary Medicines.

Chairman of Section on Practical  
Pharmacy and Dispensing

## Section on Practical Pharmacy and Dispensing

Papers Presented at the Sixty-Third Annual Convention

### MINUTES OF THE FIRST SESSION.\*

The Section on Practical Pharmacy and Dispensing was called to order at 2 o'clock p. m. in the Gold Room of the Bellevue Hotel, San Francisco, Chairman Cornelius Osseward presiding and R. W. Linton, Secretary pro tem.

Mr. Osseward: The Section on Practical Pharmacy and Dispensing will now come to order, please. Will Dr. Joseph Weinstein take the chair while I read my address.

#### THE CHAIRMAN'S ADDRESS.

Fellow Members: According to our by-laws the Chairman of each Section shall preside at each of its sessions, and shall prepare a short address treating upon the subjects connected with his Section, to be read before the Section at the annual meeting.

I am extremely grateful that the by-laws specify a short address, for such were my intentions when I first began thinking about it, all the more because the time given for this Section will be needed for the work before us.

Experience and observation during the time as Secretary of this Section last year and as your Chairman this year, has convinced me that a change should be made in the method of soliciting papers for this Section.

Past officers of this Section who have worked under this same method will admit the difficulties and shortcomings, the waste of time and money, under this method now in use. As the work of this Section has mainly to do with the improvement of things practical, it seems to me not out of place to call attention to this method which so far has proven impractical, and devise ways which will produce better results.

I find that under the present method in use about eighty percent of the letters mailed to members of the Association, asking for papers for this Section, are never answered or even acknowledged, which means that eighty percent of the work of the Chairman as far as papers are concerned is wasted or without results to the Section.

Of the remaining twenty percent there are fifteen percent who wish to be excused, which leaves five percent net gain to the Section.

You will agree with me that this is not a very good showing, that we should obtain better results with the amount of time and money spent, by trying some other method in order to put this business of obtaining papers for this Section on a reliable and practical basis.

As a suggestion in obtaining this object your Chairman recommends the following:

That a committee be appointed, the members of this committee to be of those who have served as officers of this Section; the duty of this committee to be the selection or appointment of a certain number to furnish papers for our next meeting.

This would at least give your Chairman a nucleus, and any other papers obtained by the Chairman direct would be so much more gained.

\* Discussion will accompany papers, and are therefore omitted from the minutes.

It may be the means of inducing those members who have never contributed papers, but who are capable and can draw upon good and valuable material gained by experience to become regular contributors to this Section.

In connection with this suggestion another subject might probably be handled by this committee.

The selection of timely topics on which papers are desired might probably be taken up by this committee.

If some such method could be worked out your next Chairman would be able to comply with a recent ruling of the Council which requires of the Chairman to have all papers in the hands of the General Secretary at least one month before the date of the annual meeting. Another advantage would obtain, which would give us the maximum result with the least expenditure of time, if these papers could be in the hands of the General Secretary one or even two months before the date of the annual meeting; then these papers could be printed, a certain number of members selected to study these papers and be prepared to discuss them at the annual meeting.

As you all know this Section includes the former Section on Pharmacopœias, Formularies and Standards, this no doubt will take up part of the time formerly given to this Section only, without any additional time given to this Section, and it is therefore of the greatest importance that our time is properly taken care of.

This Section has done splendid work in the past, the papers read have been of much assistance to many of us in our daily work at the prescription counter and manufacturing desk.

There is one feature which I think might be taken up in this Section, one in which every pharmacist is vitally interested and which would create still further interest in the work of this Section.

Suppose, if in addition to the papers on dispensing and manufacturing we could have some papers on improved methods in conducting the drug and dispensing departments from a financial standpoint.

Is it not true that a great number of pharmacists are in need of more up-to-date methods and would welcome such assistance coming through this Section, resulting in better and more profitable drug and prescription departments?

Who for instance is more interested and concerned in an economical and at the same time efficient and quick delivery system?

Is it not the prescription department? Would it not be possible for this Section to bring out enough new ideas which might be the means of greatly improving this difficult problem.

Short-cuts in the prescription department (saving time means cutting down expenses).

Improved arrangement of the prescription department (quicker service and concentration of space means saving of time and rental).

A record kept on freight and express charges, also cartage in your drug and prescription department might be the means of proving to many that considerable money may be saved by keeping the manufacturing counter busy.

These and many other problems which belong to the practical side of pharmacy, practical because they spell success financially and are just as important to discuss before this Section as are the improved methods of dispensing and manufacturing.

If this Section could by this means bring out methods showing how to make the prescription department more successful financially, a still greater amount of enthusiasm and success would result to this Section.

Mr. Weinstein: Gentlemen, you have heard the reading of the valuable address of the Chairman of this Section. What is your pleasure?

That address has also some recommendations. When I was an officer of this Section some years ago, I learned what the difficulties were in obtaining papers

from members. If those recommendations made by the Chairman could be carried out in some way, much good would come from them.

Mr. Hynson: The paper has been read before a small body, and every one is interested in it, and it seems to me that the Chairman might bring out the special points for action, and then we could dispose of it better than by referring it to a committee. I make the suggestion that the Chairman bring out the points to us at this time, and let us take action. I think more satisfactory results will be obtained.

Mr. Weinstein: I will entertain a motion as to what disposition to make of the address, and then the Chairman can conduct the meeting.

Mr. Hynson: I move that it take the ordinary course, that is, go to the Publication Committee, and that the Chairman be requested to bring out the points serialim on which he would like action taken at this time.

Mr. Nitardy: I second the motion.

(The motion was put and carried.)

Mr. Osseward: The recommendations I would call attention to are these: I have had difficulty in obtaining papers for this Section. Papers are obtained under difficulty, and our method has proved impracticable. It has worked out for several years the same way, and looking through the proceedings I find that each and every chairman has had the same trouble. It is very difficult to get enough papers to make a successful meeting. About eighty percent of the letters mailed to members of the Association, asking for papers for this Section, are never answered. Of the remaining twenty percent, about fifteen percent send in some excuse or other, leaving five percent to do the work of getting up the papers.

Mr. Hynson: What is your recommendation on that subject?

Mr. Osseward: My recommendation is this, that a committee be appointed at the opening of the session, the members of this committee to be those who have served as officers in previous years of the Section, because they know the duties, and they know the shortcomings of the members, the duty of this committee to be the selection or appointment of a certain number of members of this Association to furnish papers for the next meeting.

Mr. Hynson: I move the adoption of this suggestion. It is unique anyway and worthy of trial.

(Motion seconded.)

Dr. Weinstein: Is it understood that it should be done?

Mr. Osseward: I suggest it to be done right after the President's address, because the committee will have time then to select their men and report at the next meeting, and then everybody will know from whom a paper is expected. It will save the Chairman twelve months of work, and he can use that time in getting other matters in shape, and he can concentrate his efforts without worrying as to whether there will be any papers for the next meeting.

Mr. Hynson: All that anybody can get is promises, but I think it would be worth trying.

Mr. Osseward: I think it would be better if it came from a committee than from one individual. I think there is a great deal more behind it.

Mr. Weinstein: Was the motion seconded?

(The motion was again seconded.)

(Motion put and carried.)

Mr. Weinstein: The motion does not specify how many members the committee will be composed of, but I suppose that is left to the Chairman.

Mr. Weinstein: Is there any other suggestion in reference to the Chairman's address? If not, the Chairman will please take the Chair.

(Mr. Osseward then took the chair and presided.)

Mr. Osseward: The first paper on the program is by Mr. Wilbur L. Scoville on "Some Experiments in Filtration."

The paper was discussed and referred for publication. A motion was made by Mr. Lichthardt that the Scientific Section be requested to take up the subject of absorption in filtration for next meeting—Carried.

The title of the next paper was: "The Pharmacopœia as an Educational Problem for the Practical Pharmacists" by Joseph Weinstein.

Considerable discussion was participated in and the paper referred for publication; that portion particularly bearing upon a college course for older pharmacists was, on motion, referred to the American Conference of Pharmaceutical Faculties.

The next paper on Apparatus for Filling Soft Capsules, by Leon Lascoff, was presented by Mr. C. A. Mayo and its workings demonstrated. After considerable discussion, in which many practical related points were brought out, the paper was referred for publication.

The next paper on the program was by H. W. Weed, entitled, The Prescription Department as to Arrangement, Efficiency, etc. After discussion the same was referred for publication.

Chairman Osseward: I would like to hear from the Chairman of the Committee, appointed last year, on the paper by Professor H. V. Army, relating to Certified Prescriptionists. Professor Hynson is Chairman of that Committee.

Mr. Hynson: Mr. Chairman, ladies and gentlemen: Dr. Army read a paper before this Section last year which created a great deal of interest and it appears in the current number of the Druggists Circular, in regard to the formation of an *American Institute of Prescriptionists*, and the paper after being thoroughly discussed was referred to a committee, and as Chairman, I have brought in this report:

To the Officers and Members of the Section on Practical Pharmacy and Dispensing:

Gentlemen: Your committee has found Doctor Army's paper an exceedingly interesting study. It presents thoughts and suggestions which form a nucleus, through the growth of which will come much help to the proper placement of *Pharmacia vera*. The paper and its suggestions are therefore heartily commended to all those who are earnestly striving to make pharmaceutical practice more useful and who are trying to give it better relative standing amidst the vocations of the times.

The chief purpose of this committee seems to be to recommend to this Section and through it to the Association advisable action upon the suggestions of Doctor Army regarding the formation of a body of distinctive pharmacists within its own limits as comprehensive as these may be. This committee does not believe that the American Pharmaceutical Association in view of its remarkably diversified membership characteristics, can seek or encourage such an organization as proposed by Doctor Army. Your committee deems it more consistent to advise that every possible effort be made to so improve the general con-

ditions in and surrounding pharmacy as to make such an "institute" as proposed, unnecessary.

In connection with the proposition under consideration and the long discussed relationship that the practice of pharmacy bears to commerce, it is well to note the remarkable growth of scientific trading. Commerce has most encouragingly invited the application of a number of the older sciences to its service and has opened numerous new channels of profitable scientific investigation. All of which is giving to trade or commerce a continuously increasing relatively better standing in the vocations of men. Both professions and trades are becoming more and more scientific and this is fast making *true science* the standard by which all occupations are compared, both as regards their usefulness and their relative social importance.

Even a restricted or conservative view of the future's yieldings will show that the final just placement of pharmacy will not come from its separation from trade, for that is impossible. It will much more likely win the respect it deserves because of the more scientific, more ethical and if you please, *more aesthetic* development of the trade practiced with which it must necessarily be connected and, if this promise is true, it would seem to be our duty, not to elevate our noses at our trade relationships, but, rather, to exert ourselves to improve Pharmacy's natural and inseparable environments; that is, make pharmaceutical *trading more scientific*, MORE ETHICAL, MORE AESTHETIC.

Respectfully submitted,

H. P. HYNSON, Chairman.

Mr. Osseward: You have heard the report of the committee. What is your pleasure? Are there any remarks?

Dr. Army: Mr. Chairman, I move it be received, and in making the motion I would like to discuss it a minute.

Mr. Nitardy: I second the motion.

Dr. Army: I wish to say, while I have not consulted with Dr. Hynson, he has just the idea that I have. My idea in writing the paper last year was to set some of the people to thinking. I think when that happy day comes that Dr. Hynson speaks of, the education of pharmacists will be such that this question of education versus commercialism will not obtain.

I might say that in the recent number of the Druggists' Circular, Professor Jordan, one of our members, gave a very thoughtful paper *on the divorce proceedings between commercial and professional pharmacy*. We asked some of our friends to comment upon it—Doctor Hynson is one of them—and it makes as remarkable a contribution as can be imagined, and it makes a remarkable combination. The consensus of this debate was exactly what Dr. Hynson brings out, that at the present moment there is no possibility of a divorce between commercial and professional pharmacy.

(The motion was put and carried.)

Mr. Osseward: As you all know, the former Section on Pharmacopœias and Formularies has been incorporated with this Section, and a committee was appointed last year, according to instructions, to take up that subject. I appointed my committee but have heard nothing from them, and I was under the impression that probably they had sent a report to the General Secretary, which was not done. So there will be no report from that committee, as far as I can see, unless it comes in today or tomorrow morning; but we have Professor Remington with us, who will give us some information on the new Pharmacopœia. I believe it would be a good time just now to take it up, as Professor Remington is ready to do so.

Mr. Remington: Mr. Chairman—I am very glad to report the progress of the work on the new United States Pharmacopœia. No one regrets more than I the necessity for patient waiting on the part of the United States pharmacists, chemists, doctors, and all who use the Pharmacopœia.

The present cause of the delay is due to the European war. And you may wonder why the sad affairs that are taking place on the other side of the water should affect the Pharmacopœia.

This is the first pharmacopœia in the world which is being revised on the publicity plan. The publicity plan is that all changes of standards from the old Pharmacopœia which have been adopted by the new Pharmacopœia must be published and given out, so that manufacturers and others who use the Pharmacopœia may have an opportunity of criticising it, correcting it or amending it before the actual book is sent out and bound for the public.

Two years ago I was at The Hague at the Pharmaceutical Congress there, and in some way this resolution of the Convention became known to the representatives of the foreign pharmacopœias. And I remember very well that Professor Tschirch, of Berne, expressed in a few words his idea of this way of getting out a pharmacopœia. I had to explain the method, that we were going to publish it in advance to the world, so that they could see all the changes that were going to be made in it. He said, "We never could do that in my country." And various members got up, representing the various countries, and they were astonished, and they classed it as one of those Yankee ideas that they get over on the other side of the water which are very good. (Applause.)

And it is quite probable, I think quite possible, that many of the foreign pharmacopœias will follow that idea.

Of course, you all see the utility of publication and publicity. Here is a large wholesale manufacturer, wholesale druggist, or even retail druggist, who is given ample opportunity to know what is coming, so that he will not make a great lot of preparations which will be dead stock for him.

Then, again, the United States Pharmacopœia is now the law of the land. It is a law book; it was not at the last meeting. It is now a law book, and it is necessary to cover every possible objection that there might be.

Again, in regard to publicity, it was objected at the time that some one—some chemical manufacturer—that will illustrate it better—some chemical manufacturer would get some patented or secret methods of making or purifying some chemical product. Well, he would present that to the Committee of Revision and expect to have his own particular pet incorporated in the pharmacopœia at the expense of his competitor. Well, I want to say that this publicity has been in operation now for two or three years. Every proposition to amend is put before the committee. We have the committee on organic chemicals and the committee on inorganic chemicals, and the committee on fifteen different branches of the work. Any suggestion or amendment or correction must go before that sub-committee. Now, some of the members of the sub-committee are manufacturers themselves. And any one manufacturer attempting to get any special advantage over the other, is aware of the fact that his critics or competitors will be right after him. If they don't hear it at a meeting of the committee, they will see the proposition in print. So that co-operation in all branches of pharmacy interested in the Pharmacopœia has in this way been secured.

Again, if a manufacturer finds something in the Pharmacopœia after it is issued that he don't like, we can say to him, "Why don't you read the Journal? It was all published, and now if you find some fault with it, it is your own negligence."

This has entailed a great lot of work, but I think it is going to tend very largely to make the Pharmacopœia as perfect as possible.

The delay now has been caused, I said, by the European war, because a resolution was passed in the Committee of Revision that where a substance was up for

admission in the Pharmacopœia, that if it was protected in any way by proprietary rights, patents, trademarks, copyrights, and so on, that if the doctors on the committee who had charge of the introduction of the article into the Pharmacopœia—what we call a Committee on Scope—it should be first referred to them. If the physicians on the committee agreed that it was important enough and good enough to put into the Pharmacopœia, if it was a protected article, that the manufacturer should be notified that it was the intention to introduce this article, but the committee must have the approval of the man who owns it. The laws recognize the fact—the patent laws have given him a patent, and those rights he has acquired in a legal way. Consequently, you need not expect to find in the Pharmacopœia some of the well-known synthetics. There are certain things in there which are well known which would have been admitted to the Pharmacopœia, but you will understand that the Committee of Revision have conferred with the manufacturer and he declined to have it go in the Pharmacopœia. Naturally they are not in business for love, but they are in business to protect their own interests.

And we find that wherever a chemical substance—I say chemical substance, but wherever a patent is about to expire, the tendency on the part of the manufacturer is to say, "Yes, I would like to have it in the Pharmacopœia, because our rights expire in a few months." And, of course, it is a big advertisement for them to continue the sale and use of that article, because we have adopted it and put it in. But where the patent has eight years to run, the manufacturer says, "No, we would rather you would not put it in." The reason is because it would show others and they could make that preparation under a chemical name.

An illustration of this is aspirin. We applied to the Farbenfabriken Company to put in aspirin. The rights on aspirin were about to run out, and, of course, we thought that probably they would be willing. While that was going on, a suit was started in Holland on this subject, and a firm there had introduced aspirin under the name of acetyl salicylic acid, its chemical name.

I arrived at the hotel in Rotterdam and I needed some aspirin to quiet my nerves, and so I went around the corner to a drug store and found there a young woman in charge—one of the pretty Dutch girls, with blonde hair, and I said, "I want some aspirin."

I would say incidentally that in every drug store in Rotterdam and Amsterdam and throughout Holland you would always find a girl there, and they astonished me when we had a report in the Congress as to the practice of pharmacy throughout Europe, the number of women who are engaged in pharmacy—a far larger number than there are in this country in proportion.

And she said, "Probably you would like to have aspirin, but I can give you something here which is much cheaper." And I said, "Is it just as good as aspirin?" (Laughter.) And she went immediately to the case and brought me out acetyl salicylic acid put up in bottles, twenty tablets in a bottle. There was not a word on it like aspirin, but it said acetyl salicylic acid.

I said, "Certainly. How many have you there?" She said, "I have three left, ten cents apiece." My exchequer would stand that, so I got all three. I have two of those at home that I can show you to let you see what is going on.

After that time I saw a decision from the highest court in Holland where the Farbenfabriken Company had sued this manufacturer of the so-called acetyl salicylic acid. It was not put up in imitation at all. In large letters it said, "Acetyl salicylic acid," and there was no attempt to indicate that it was anything else.

I mention this to show how the courts are likely to rule in these cases. The court heard the evidence on both sides. This manufacturer of acetyl salicylic acid had made a good product. There was no room on the part of anyone to doubt that it was aspirin absolutely. There was nothing else in it. It was pure

acetyl salicylic acid, which is what the manufacturers claim for aspirin. But the judge took the view that that was intended as a substitute for aspirin. Now in addition to that, the foreign Pharmacopœia had introduced acetyl salicylic acid in the book, and the judge simply tore out that. He said, "That makes no difference. This man that is making acetyl salicylic is defrauding the aspirin people of their profit on it."

These judges look at the thing solely from the right of the individual, and if there is any legal right, the patent is secure, and there is no flaw about the patent, they simply say they don't care anything about the Pharmacopœia, whether it is in there or not, this man got the Revision Committee to put it in there, that is all, but it don't alter the right of the thing; and, Mr. President, this firm had to render an account of every bottle of that acetyl salicylic acid that they had sold, and then they were mulcted in damages, because, as the judge saw it, it was interfering with the rights of the Farbenfabriken Company. So the Pharmacopœial Committee, through a resolution which was passed, requested or asked the Committee of Revision, the Chairman of the Committee of Revision, to write to the manufacturers of such products that are accepted by the physicians and see if they would allow the Pharmacopœia to adopt them and put them in the Pharmacopœia under chemical names and thus use them.

Well, that correspondence has taken a good deal of time. We thought everything was going swimmingly. I fully expected to have the Pharmacopœia out in October, but the war came on and the New York agent and the agents in this country were appealed to. They universally said, "We appreciate your courtesy, and we will be glad to help you, and we will forward to the main houses and manufacturers in Germany your request." Naturally they had to refer it to the firm or corporation itself.

Now, we have just received the answers from these firms, and the important ones all say very politely and courteously, "If it is all the same to you, we don't want our products in the Pharmacopœia."

So you will find some of them not there, but you will find a good number of these synthetics in there. And that is what is now keeping us back. But we are getting along. Here, Mr. President, is the Pharmacopœia as far as we have it in print. In the back part the tables are all done, and there is nothing now to do but to go ahead with the proof, and here are the first twenty-five pages which have just been taken off since I have been out here—there will be fifty more soon—we are going ahead, and this is the way the new United States Pharmacopœia will look—the type and arrangement of it. I have copies of these that I will pass around.

Now, I will answer any question, Mr. Chairman.

Mr. Osseward: Any questions you would like to ask Professor Remington?

Mr. Remington: Another thing. Everybody has asked when will it be out. We hope to give you a New Year's present.

Mr. Nitardy: I would like to ask Professor Remington the question as to what will be the status of such drugs as are included in the Pharmacopœia under new names that are still under a patent right that has not expired, such as you mentioned would soon expire.

Mr. Remington: The Pharmacopœia has always occupied this position, that it is not a book which is intended to advertise any man's product, and we don't propose to use trional or sulphonal or adrenalin or any of those names which are popular, because we cannot do it. But after a thing has been before the public 14 years and the patent has run out, and it is still used and the patent is invalid, of course it can be adopted; but we don't put in anything that is not an authentic

chemical entity. It goes in, however, under its chemical name, and then we don't expect the manufacturer is going to kick. But if he says, "No, I won't have it," what is the use of having twenty or thirty lawsuits just for putting something in that a doctor can get anyway?

Mr. Nitardy: That was not what I was trying to get at. I was going to ask if this permission to put a copyrighted article in the Pharmacopœia under a chemical title would give a consent on the part of the owner of that copyright that that product might be put on the market.

Mr. Remington: Certainly. I see your point. You want to know whether any manufacturer could make such an article as acetyl salicylic acid under that name without calling it aspirin?

Mr. Nitardy: Yes.

Mr. Remington: Yes, certainly he could, and that is what the whole fight is about. As I tried to say before, take aspirin ten years ago—a valuable medicine it has proved to be—why, they would certainly enter suit against the Pharmacopœia at once if we were to describe something there as aspirin, just use their name; their copyright protects them in their trademark or whatever it is. You cannot use the word "aspirin" just exactly as you cannot use adrenalin today. It is all tied up. We cannot put adrenalin in the Pharmacopœia. It was proposed to put it in under the name of liquor epinephrin, but epinephrin is not a commercial product. That is the name given to it by Johns Hopkins University. It has all been settled by the courts. Parke, Davis & Company, went to the British Pharmacopœia, and they said to Doctor Tirard, "Yes, we want that in there." They said, "Under what name?" Parke, Davis said 'As adrenalin—nothing else. We won't give you permission to put it in the British Pharmacopœia unless you use 'adrenalin' and that has got to be the thing.'

Mr. Weinstein: I want to ask a question. Assuming that the Pharmacopœia will be out at New Year's, how much time will then be allowed before it goes into effect?

Mr. Remington: I think about three months.

Mr. Weinstein: Not six months the way we have done?

Mr. Remington: I don't know yet.

Mr. Weinstein: We want to know what stock to put in.

Mr. Remington: I would say, Mr. President, that in addition to publicity, which I have spoken of here, so the druggists won't stock up with thousands of pounds of things that might not be right when the new Pharmacopœia comes out,—that is the first danger signal—that is why we published it. Now, the manufacturer knows about that and he is not going to be foolish enough to go ahead on the old Pharmacopœia and lay in a big lot of stock. But in addition to that there will be printed on the first page of the Pharmacopœia, the title page, "Official after March 1st, or April 1st, or June 1st, or whatever may be decided.

Mr. Weinstein: At least three months?

Mr. Remington: At least three months, and it may be six months before the new pharmacopœia will be in effect. By that time you can sell present pharmacopœial preparations, but you will not be held up until after the date mentioned on the title page that it is to go into effect.

Mr. Weinstein: Especially is it important in the sale of retail drugs. We had

trouble with tincture of aconite and things like that. We didn't know how long it would take.

Mr. Osseward: Are there any other questions? We are much obliged to Professor Remington for giving us this information, in view of the fact that the Committee on Pharmacopœias has not yet reported. I am extremely glad that we have heard these remarks.

Mr. Nitardy: Mr. Chairman, I would like to ask another question of Professor Remington. Is there at present a sort of compilation of changes in the new Pharmacopœia that has been published by the committee that is available.

Mr. Remington: It is all in the Journal of the American Pharmaceutical Association.

Mr. Nitardy: This month?

Mr. Remington: No. It has been going for six months.

Mr. Nitardy: I meant a concise showing.

Mr. Remington: No.

Mr. Nitardy: I had hoped that there was such a thing.

Mr. Remington: That would not be a good business move. I know one dear old member of the Philadelphia College of Pharmacy. He came up to me once with a brilliant idea. He said, "Now why do you get out these editions of this book?" He says, "Why don't you put them all on pages, all the changes that you make, and sell them for ten cents or fifteen cents, or twenty-five cents, so these could be pasted in the books and the old editions used?" Well, the answer I made was that my publishers would not permit me to do so.

Mr. Osseward: The next paper on the program will be by Mr. Lichthardt on "Some Laboratory Notes."

Mr. Lichthardt: This paper is short. It deals with tests I made five years ago this month, and I noticed a couple of years ago some writer in the Government service had stated that they found it to be extremely reliable, and it pleased me very much. I had not heard from my caramel test up to that time, although I had received some letters from experimenters and others. This little paper takes up that matter, and also on the subject of necessity of being careful when you are doing your testing.

After discussion the paper was referred for publication.

Mr. Osseward: I have two papers which have been referred from the Council to this Section. One is from Chairman Beringer, on behalf of the Committee on Standards for Unofficial Drugs and Chemical Products. I suppose these really ought to be taken up so they can be disposed of or returned to the Council or to the Secretary. Then I have another one by Otto Raubenheimer, who is Chairman on the Section on Pharmacopœias and Formularies. What is your pleasure? Shall we take those up now?

Mr. Mayo: I believe they are merely intended for publication. If you have ample time, the members might like to have them read, but unless you do have ample time, it does not do very much good to read a formula. I presume they are formulas.

Mr. Osseward: No, they are just reports from the chairman of the committee.

Dr. Army: I think both of them are very important reports and we should hear them.

Mr. Mayo: I move they be read.

(Motion seconded, put and carried.)

#### REPORT OF COMMITTEE ON RECIPE BOOK

This first Committee on Recipe Book was appointed in 1910 and presented its report to the Council on May 8th, 1911, which was published in the Journal A. Ph. A., Vol. I, p. 168, and which should be of interest to every pharmacist. This Report dealt with the following subdivisions:

- (1) Advisability of publication
- (2) Scope of character
- (3) Plans and details of publication.

As a result of the work of that Committee 114 formulas were published in installments in the Journal A. Ph. A. for 1912 in the department of "Pharmaceutical Formulas," created for that purpose.

Much has been said "pro and con" the work of such a committee and "pro and con" the publication of such a "Recipe Book" by the A. Ph. A. That such a book is needed and needed badly is the unanimous opinion of all practical dispensing pharmacists.

Your Chairman on numerous occasions has called attention to the necessity of a compilation of reliable formulas, formulas which are hard to find or which cannot be found f. i. the one of "Lotio Alba" (see Journal A. Ph. A., Vol. III, p. 692.) Willingly your Chairman has acted as a National, in fact, an International Information Bureau on matters pharmaceutical and quite especially on formulas. Lately again, I have had numerous inquiries by 'phone and mail, for the formula of *Tinctura Ferri Acetica Aetherea*, which has been brought back to life by being prescribed by physicians in the United States. But where, Oh! where, can you find a formula for same? None of the Dispensatories and none of the many Formularies give a recipe for this preparation. The nomenclature evidently betrays a foreign and quite especially a German origin. "Made in Germany" is true of this preparation! Was it not the Berlin apothecary and founder of the "mineral chemistry," Martin Heinrich Klaproth (1743-1817) who introduced in 1801 *Liquor Ferri Acetici* and *Tinctura Ferri Acetica Aetherea* into the *Pharmacopoea Borussica*? However, the last or 5th edition of the *Deutsche Arzneibuch* does not contain such a preparation, and the same is true of the fourth edition. But the 3d edition of the *Arzneibuch* provides a formula for the so-called Klaproth's *Tinctura Martis*.

Just think of it! This tincture is again rejuvenated in 1915, far away from its "Fatherland." Truly a verification of the words of Horace, which were also placed on the front page of the first and most important and legal dispensatory of Valerius Cordus, published as early as 1564:

Multa Renascentur, quae jam Cecidere;  
Cadentque, quae nunc sunt in Honore.

(Many things shall be brought to life, which have fallen,  
And many things which now are honored, shall fall.)

#### FATE OF THE A. PH. A. RECIPE BOOK.

What is to be the fate of the Recipe Book? This is one of the pertinent questions of today in the Association. Is it to die a natural death? Is this wish of the pessimists to be fulfilled? It surely will be if no different arrangements are made. Permit me to point out some of the faults of this Committee and allow me to make a recommendation to the Council. The chief fault is that there is a different committee appointed by the President each year. This was done this year, for instance, in the early summer of 1915. You can readily see that before the committee has a chance to become acquainted and to get to work and *do something*, the annual convention is at hand and a report has to be submitted. This is what I call "dying a natural death!"

Now as to the remedy, which is very simple indeed! Let the Council appoint a *standing* Committee on Recipe Book, to consist of a chairman and a certain number of members, f. i. fourteen. The reason why I recommend 14 members, besides the chairman, is that according to the original idea of the Committee on Recipe Book, this work is to be divided into 7 different parts and each part should be compiled by 2 pharmacists, who are experts in this particular line. This is my recommendation and I hope the council will act on it at the San Francisco Convention.

"To be or not to be an A. Ph. A. Recipe Book" is a most important and vital question, which should be decided without further delay! Far be it from the writer to look for the chairmanship of this important *standing* committee, as I would much rather prefer to act as referee on foreign formulas, which subject I have made a special study for some time.

Placed on a sound basis and with a *Standing Committee* the A. Ph. A. Recipe Book will soon be forthcoming, after being published in installments in the *Journal*, and will be an everlasting credit to the A. Ph. A., the Association which is foremost in pharmacy throughout the entire world!

Respectfully Submitted,

OTTO RAUBENHEIMER, Chairman.

Dr. Army: I move that the report be received and that the recommendation be forwarded to the Council with our recommendation.

(Motion seconded, put and carried.)

Mr. Osseward: The other report is by George M. Beringer and was referred to the Council.

Mr. Osseward: I have one long paper here, "A Few Good Toilet Preparations," by H. S. Groat. If you wish to continue—it is 20 minutes after 5 and we have to nominate officers, I suppose at this session. I still have another paper besides that.

Dr. Army: This paper was prepared by my assistant, Doctor Hostmann, at my suggestion, and I would like to read it. The subject is, "The Miscibility of Ichthyol." Both papers were discussed and referred for publication.

Mr. Osseward: Mr. Latham promised a paper on "Plasters," but I have not received it. Another by Mr. Roemer of White Plains, N. Y. (This paper has since been received.—Ed.)

Mr. Osseward: Now, then, the nomination of officers for this Section is in order.

The following names were placed in nomination: For Chairman, Joseph Weinstein; for Secretary, H. B. Se Cheverell; for Associate, Frank Berg.

Mr. Mayo: I move you that we adjourn for three minutes as the officers must be elected at a separate session.

Dr. Army: I second the motion.

(The motion was put and carried and the meeting adjourned at 5:57 P. M.)

## SECOND SESSION.

Mr. Osseward: (AFTER RECESS) The meeting will come to order.

Mr. Mayo: I move we proceed to the election of officers.

Mr. Osseward: The Section has nominated Dr. Weinstein, of New York, for Chairman of our Section for the next year.

Dr. Army: I move the Secretary be requested to cast the ballot for Doctor Weinstein.

(The motion was seconded, put and carried, and the Secretary cast the ballot.)

Mr. Mayo: I move that the Secretary cast the ballot for Mr. Se Cheverell for Secretary.

(The motion was seconded, put and carried, and the Secretary cast the ballot.)

Mr. Se Cheverell: I make the same motion as to Mr. Berg for Associate.

(The motion was seconded, put and carried, and the Secretary cast the ballot.)

Mr. Fletcher: I move we adjourn.

Mr. Mayo: Before we adjourn, we should present the new officers. It affords me pleasure to present Dr. Weinstein, a man who represents true pharmacy, and who is a very pillar of pharmacy in the State of New York. Gentlemen, whenever we find pharmaceutical gatherings, Doctor Weinstein is there. He has a large coterie of friends in the New York retail drug business. Dr. Weinstein has been a worker in pharmacy and for pharmacy for a great many years. I have pleasure in introducing Doctor Weinstein, the new Chairman.

Mr. Osseward: Doctor Weinstein, it gives me pleasure to give you the Chair, and I can only say that I will be pleased to assist you in every way I can to make the session next year a good one.

Doctor Weinstein: Gentlemen, I almost lost my breath at hearing that great introduction delivered by your worthy President. I don't know whether I deserve all that praise, but I will try to do something next year and try and select the right men to assist me. I promise you I will do the best in my power.

Mr. Mayo: The mere fact that a man is young is no bar to his usefulness. Mr. Se Cheverell referred to the fact that he was young in the Association. It is a fact that we have young men in the Association, and they have been of great assistance to us. We have had good young men from Denver. Nitardy was one of the best officers we have had in this Section. Mr. Se Cheverell is a young man, and I have great pleasure in introducing him as your new Secretary.

Mr. Se Cheverell: All I can say is I will do my very best.

Dr. Weinstein: Then I can bank on that. Is there any further business before this Section? If not, a motion to adjourn will be in order.

Dr. Army: I move we adjourn.

(Motion seconded, put and carried.)

(Adjourned at 6:07 P. M.)

## THE NEW PHARMACOPEIA AS AN EDUCATIONAL PROBLEM FOR THE PRACTICAL PHARMACIST.\*

JOSEPH WEINSTEIN, PHAR. D.

The ninth edition of the U. S. Pharmacopeia will soon be completed. The committee of Revision has spared no effort to make this book represent the last word of the pharmaceutical science.

The nomenclature, the macro- and micro-copical pharmacognostic descriptions of botanical drugs, the chemistry of substances are minutely described; the modus operandi in preparing galenicals, the purity rubrics, the assay processes, each and

\* Read before the Section on Practical Pharmacy and Dispensing, San Francisco.

all will bear testimony to the scientific character, and to the up-to-dateness of the work.

The new book will soon be placed in the hands of the pharmacist, unto whom it is the law by which he is to abide, to its commands he must strictly adhere and with all its requirements he is obliged to comply. Thus the decennial revision of the *Pharmacopœia* becomes a compelling power on the pharmacist to keep abreast of the times, for punishment is in store for him for failure to comply with the changed requirements.

Unique indeed is in this respect the position of the pharmacist. There is no such a thing as compelling any other professional to decennially change his ways. If a physician be desirous to take up present day methods, good and well, but no law will interfere with the medicus, for instance, for remaining loyal to the old-fashioned arsenic treatment in leucæmia and for his not resorting to the somewhat more successful benzol medication and X-ray treatment. Not so with the pharmacist. "Thou shalt not go any longer by old methods; by the new and latest abide"—is the dictate to him, and he must do so.

This order of things, whereby the druggist is to be kept from getting rusty and is to be prevented from becoming fossilized: this peremptory fiat on the pharmacist to imbibe the last and best in his science and this lifting pharmacy upwards, though accepted by all as a matter of course and very gratifying to all true lovers of professional pharmacy, is somewhat perplexing to me, causing me some uneasiness and placing me in the category of questioners.

I am inclined to ask, whether the rank and file of the pharmacists are sufficiently prepared to take up the advanced methods prescribed by the *Pharmacopœia*. Being fully aware that in many a state not even the minimum two-year course in a pharmacy school is required for license to practice pharmacy. I feel like asking what is at present the percentage of pharmacists in the United States fully able to meet the high expectations of them? For, could one, to whom no laboratory training was given, be expected to apply chemical tests and to perform assay processes for determining the alkaloidal strength of some of his galenical preparations? Or could one, who has never seen a compound microscope be expected to examine his drugs microscopically?

Truly, were I to be called upon for an expert opinion on the liability of the pharmacist, I would declare, that whenever the requirements of the licensing board are not sufficiently high and do not measure up to the knowledge exacted of him by the *Pharmacopœia*, the pharmacist can not be answerable for his shortcomings, for he is not fully responsible.

By giving this opinion of mine I do not wish to convey the impression that our standard is too high, and that something is to be done to retard the progress of pharmacy. Far be it from me. The disagreeable truth is told with the object of calling attention to the necessity of action for improving the status of pharmaceutical education, and especially to help those who, through no fault of their own, are behind the times, but if given the opportunity, would be only too happy to add to their store of knowledge.

With this object in view I would advocate, firstly, that a standard be established for pharmaceutical education in the United States, below which no board shall have the authority to go, and which should be sufficiently high to make a phar-

maciſt fully prepared for his work, as that preparation is underſtood in our day. When this is agreed upon, boards of pharmacy, eſpecially in the ſtates that have no college prerequisite, ſhall not license a pharmacist on the ſtrength of his theoretical knowledge only, conſiſting of written answers to the examination queſtions, but ſubmit the candidate to a thorough practical examination as to his ability to teſt the purity of his drugs, to do analytical work, etc.

Secondly, for the benefit of thoſe members of our profeſſion, who became ſuch in years gone by, when the requirements were low, or who acquired their calling in ſections of the country where no college training was required and where the boards were eaſy, but who, nevertheless, I dare ſay, are numbered by the thouſands, the facilities of additional learning be granted, by the eſtabliſhment of ſpecial pharmacopeia courſes.

Let the ſchools of pharmacy throw their doors wide open for all thoſe who deſire to get information on everything pertaining to the Pharmacopeia, without any preliminary requirements and at hours convenient for the retail druggiſt. The courſes ſhould be conducted on practical lines only, ſuch as teſting for impurities, aſſay proceſſes, etc., entirely eliminating theoretical inſtruction. Courſes of that kind would be productive of great good, and they would help to do away with the anomalous ſtate of affairs, where ever-increasing knowledge is required of the pharmacist without giving him an opportunity to acquire ſame. This is a great promiſing field for our educators, of whom many are alſo members of the Revision Committee and who are familiar with the theological lore, that when Moſes legiſlated for the Iſraelites in the wilderneſs, he clearly perceived the unpreparedneſs of his contemporaries to adopt his laws, his code of ethics, but he proceeded with his work, having in mind the fact, that his own generation would die off, and aiming at their deſcendants and at generations to come, who would be more fit for his teachings.

Let us hope our members of the Revision Committee have not aimed that far, for the thouſands of pharmacists who are not fully up to the preſent day requirements are not quite ready to die; they wiſh to live and to compete with us, and they can, through the agency of additional work taken up at ſpecial courſes, become good and uſeful members of our great pharmaceutical fraternity.

#### DISCUSSION.

Dr. Weinstein: Now, I want to mention that my object in this paper was to bring out ſome diſcuſſion on this ſubject. I came to the idea that it is not exactly required of a practicing pharmacist that he ſhall take up a ſpecial courſe in a college of pharmacy, that he ſhould know all about the theory, juſt the ſame as it is not required for a worker in a drug ſtore to know the formula of every preparation that is ſold. Thouſands upon thouſands of pharmacists would be glad to take up practical work in a college of pharmacy if opportunity would be given to them. Not long ago one college in New York City provided a ſpecial courſe in materia medica, and I know thoſe who attended were very glad of it, ſome of thoſe druggiſts who have been proſecuted by the Board of Pharmacy in the City of New York. The trouble is that the average pharmacist has never been to ſchool. I am ſpeaking of thoſe who are not college graduates. They don't know. For them it is terra incognita. If you ſhow a man once how the thing is done, he will be able to maſter it and be able to make teſts of preparations that he handles in his ſtore. If the colleges would think of this and open courſes ſo that the pharmacists could take up ſpecial training in teſting preparations, I think both the colleges and the pharmacists would gain conſiderable.

Dr. Army: In helping the discussion along, I heartily commend all that Dr. Weinstein has suggested. I wish it were possible to do in this country today as Prof. Tschirch of Berne has done. When the Swiss Pharmacopœia came out, he arranged a six weeks' summer course in Switzerland, in the city of Berne, where the pharmacists got together. I believe he had as many as a hundred there. They came together and had a six weeks' vacation, and at the same time learned the new pharmacopœia. Dr. Weinstein has spoken of the institution with which I am connected, and I would like, for the benefit of our friends who are connected with other colleges, to mention what we are doing in that direction. Last year Dr. Mansfield started several courses. He had forty-five men and women. The courses were so successful that this year we have decided to start an evening course on the subject of the new Pharmacopœia. There shall be, first of all, the laboratory work in the pharmaceutical laboratory. But we feel that will not be so attractive. Then the assay classes. Then Dr. Dickman and myself are going to give an hour lecture once a week on the changes, chemical and pharmaceutical, in the Pharmacopœia. We feel sure it will be appreciated, for the reason that Dr. Mansfield's course was so appreciated last year. These are simply extension courses. A fee is to be charged by the college, and I think an exceedingly reasonable fee. I think this should be done by every college of pharmacy in the country. In state university towns it may be different, but I strongly advise the city colleges to do this thing. In New York, there is no danger of any of our boys taking the course, because they are required to be graduates in pharmacy, but we are going after men who have been in the business twenty-five years. When Dr. Mansfield first spoke of it, I didn't think much of it, but when I saw the character of the men, men forty and fifty years old, men who are taking it, then I considered it valuable. Ex-presidents of associations were going there, and it is a wonderful thing, and I think something in the way of a vacation course might be given in the state universities.

You have heard of the night courses in Cooper Institute. They have a night course in Cooper and made progress last year. We feel we ought to do the same. It is done merely from the standpoint of helpfulness. I strongly commend the idea to all colleges.

Mr. Osseward: There is another point. With us the pharmacists cannot come before the Board unless they have graduated from a college. They must have attended the two years' college course. When they come to us they answer that they cannot go to school. They have families to support and it is impossible for them to go to school. If those men could have a little assistance I think it would be helpful.

Dr. Anderson: I believe one point has not been taken up. We are also preparing a course similar to that outlined by Dr. Army. We feel that the retail druggists of Kings County, where our college is situated, are entitled to this service. Our institution was founded and built up and has always been conducted and controlled by the Kings County Pharmaceutical Society. There is another service feature we are taking up, one which was recommended by our president in his last annual address. This is an instance where a trustee has ideas that have not occurred to most of the faculty. President Smith recommended in his annual address that we extend this course to prepare pharmacists for positions in the United States Army or Navy qualifying them for work required in this service. So we intend to incorporate that particular feature in addition to preparing the older pharmacists to do work with reference to the new Pharmacopœia.

## APPARATUS FOR FILLING SOFT CAPSULES.\*

J. LEON LASCOFF, PHAR. D.

My object in presenting this paper is not to discuss the origin or the use of soft capsules (as this is known to every pharmacist), but to acquaint the profession with an easy and time-saving device, which does away with the old method of filling the soft capsules with a dropper or burette. At present the dispensing pharmacist, as well as the manufacturing chemist, fills the soft capsules by setting them on a perforated wooden rack, or shallow box with a perforated cover, introduces the liquid drop by drop with a pipette or burette; when filled the capsules are sealed with melted gelatine.

Sealing Capsules.

Filling Capsules.

This method, as we all know, takes up a considerable length of time, requiring a great deal of care, and is troublesome at best, and if one is called upon to do other things, time is a very important factor.

Two years ago I had the pleasure of presenting a paper before the same section on the subject of Ampoules and the method of filling same automatically; also exhibited a simple apparatus for this purpose, which I devised, as the result of a suggestion by Mr. Caswell A. Mayo at a meeting of our local branch several years prior to this.

The outcome of this little apparatus was regarded very favorably; several of the colleges adopted its use. It occurred to me that the same fundamental principle involved in this procedure could be applied to a gelatine container as well as a glass one.

I am sure that this small and simple device will appeal to all pharmacists and manufacturers as the most practical, inexpensive, easy to manipulate, time-saving, clean and accurate procedure.

\* Read before Section on Practical Pharmacy and Dispensing, San Francisco Meeting.

It consists of a glass receptacle, hermetically sealed, operated by means of a suction hand pump and the capsule retainer. The contents to be used to fill the soft capsule enter automatically; when completed they are sealed and washed off with a little Ether or Alcohol.

There is no question in my mind that physicians do not prescribe soft capsules freshly made with their own formulæ, because they know how troublesome it is to make them under the ordinary circumstances. When one considers the time consumed in making, we will say 30 capsules *at once*, that does not take any

LASCOFF'S SOFT CAPSULE AND AMPOULE FILLER.

Fig. 1.—A 4-ounce, screw-cap ointment jar; tube (4) and rubber tube (5) connect the former to an aspirator (6). An aluminum disc, see figures II and III, is placed within the jar; the disc is perforated so as to admit the necks of soft capsules. In the center of this disc is an upright (10) provided with a lug (10b) and with an offset (10a). Plate (11) has a cylindrical opening in the center for upright (10). Plate (11) is held in place by slotted nut (12), and the capsules, after removing the tips are inserted as shown in figure I. After the capsules are inserted and the frame put in the jar and the medicated liquid, the screw cap thoroughly fastened on, the air is removed by means of the aspirator and is then gradually allowed to return when the liquid will be forced into the capsules. The cover is removed, the aluminum holder taken out and inverted so as to have the opening of the capsules up. The surplus liquid is removed from the capsules and then sealed by means of melted gelatin.

longer with this apparatus than the filling of two or three by hand, we can easily conclude what financial gain we will derive by encouraging the prescriber to call for any combination of his own, freshly prepared.

In searching the various textbooks, like Remington's, Arny's or Caspari's, one can find descriptions and illustrations of hundreds of devices to facilitate manufacturing and dispensing, both on a small and large scale for every possible pur-

pose and for the filling of soft capsules all of them have the one fundamental principle and that is—to fill them *one by one*. The difference being only in the method of dropping the fluid into the capsule itself and the particular retaining base to hold the capsule while being filled.

For the hard capsule we have the Parke, Davis & Co. Capsule-Filler, Ihrig's and Remington's Hard Capsule Filler where large quantities are made at one time, but *not one* apparatus or device could I find to fulfill the purpose which this little apparatus does, especially when the same apparatus can perform two purposes, that is the filling of soft capsules as well as glass ampoules.

*What is gained by this apparatus?*

- 1) Any given number of soft capsules can be filled *at one* time, according to the size.
- (2) Equal division of dose is accomplished without extra manipulation.
- (3) Being constructed of glass and metal, it is easily cleaned and sterilized if necessary.
- (4) The cost is nominal.
- (5) It is very easy to manipulate, and
- (6) Last and not least, the time- and labor-economy.

#### DISCUSSION.

Mr. Hynson: I have been a strong advocate of the soft and elastic capsule, but I believe now the hard capsule is more satisfactory for prescription work than the soft capsule. I believe you can get more satisfactory results, more permanent results, in the hard capsule, and within the bounds of the number 1, or 0 capsule, they are just as easily filled and they dissolve as well.

I think the great objection to this method is that it is going to take you three or four times as long to prepare the filler for six or twelve capsules as it would if you put them up in the old method.

There is one point in filling capsules, and that is, not to have any oil on the capsule; for there is difficulty in removing it, and the smallest amount interferes with a perfect seal.

In this connection, if I may be allowed to say it, I think the personal equation of the dispenser comes more in play in the handling of the liquid gelatin than anything else. With the greatest effort I have tried to fix some standard by which I could instruct the student and the clerks so that they could have this liquefied gelatin in a proper condition for use. I would like somebody to tell me how they are going to do that except to learn, like the candymaker and the cook, and all those people do, by the touch of the thing, by the feel of it, exactly the condition it should be in. Now, if there is any other rule of doing that than simply by practice, I would like to know it.

Mr. Lengfeld: I would like to say that in sealing capsules I have had lots of trouble, but I find by using a little hot water on a piece of cotton and wiping off the top of the capsule I have less than one percent of leak. It turns a round edge just as if they were cut by machinery.

Mr. Nitardy: In connection with the filling of soft, elastic capsules, I would like to bear out the remarks of several gentlemen I have heard here. We formerly cut them at the shoulder; we now cut them long first, fill them, and after they are stacked up in the holders we then take a pair of scissors and cut them level with the shoulder, giving us a new clean edge, that has never been touched by anything, to seal.

In regard to sealing, I think Dr. Hynson is absolutely right—there is nothing but practice which will show you how the gelatin should be. We save the pieces cut off the capsules for melting up and getting our sealing solution, which makes it unnecessary to make a solution of gelatin and glycerin of the same proportion to have the same consistency and elasticity as that of which the capsules are made.

Mr. Lichthardt: The question in my mind is the accuracy of apparatus like that. Suppose the physician orders a five or ten minim capsule of some oil and you use that apparatus, how do you know you have got five or ten minims in that capsule?

Mr. Hynson: You test the capacity of the capsule beforehand.

Mr. Lichthardt: I have found them to vary.

Mr. Osseward: I want to state that you cannot depend on the capacity of the capsule; five minim capsules may hold six or seven, or maybe ten.

Mr. Hynson: Then you make up your bulk for all the capsules. I have never measured the contents before they were put in, but I measure the capsule and make up a mixture and dilute it up to the capacity of the capsule, some multiple of the number of capsules I want to fill, and fill each capsule to a certain point.

Mr. Osseward: There is another point regarding the sealing. It is just as you said, the only way to learn as to the consistency of the gelatin is by practice. There is evaporation of water going on while you are sealing capsules. You have to watch that very closely. So you need an experienced man.

---

### SAND TUBES FOR THE RAPID SEPARATION OF TYPHOID BACILLI.

Several methods for the isolation of typhoid bacilli have been published, based on the much greater mobility of that organism than of the bacteria which accompany it in dejecta. The method now suggested by the authors is claimed to be rapid, simple, and effective. It consists virtually of a sand filter, which the typhoid organisms can penetrate at a much greater speed than other germs. A glass tube about 33 cm. long and 5 to 6 mm. in diameter is drawn out somewhat in the middle and bent in a U. The constricted portion is then filled with sterile sand to a height of about 10 cm. and the open ends of the tube are plugged with cotton. Broth or other culture medium is then introduced through one branch of the tube in such quantity that it reaches a level about 10 cm. deep above the sand bed in each branch. This may, if needed, easily be adjusted by means of a fine pipette. The filling may be either carried out aseptically or the completed apparatus may be sterilized. It is then set aside for twenty-four hours to ensure its sterile condition. The culture broth in one branch is then inoculated with a few drops of intestinal washing obtained after first administering an evacuant enema. This washing will generally be almost clear and contain only a small amount of suspended particles. The apparatus is then incubated at 37° C. for eighteen hours. When the stools contain typhoid germs the culture liquid in the other branch of the tube will frequently be cloudy, and typhoid bacilli may be detected by direct micro-examination. Occasionally the presence of *B. coli* may require a second culture in another sand tube. This will give a pure culture in the time indicated. If no bacteria pass through the sand in eighteen hours the typhoid bacillus is probably absent. A longer incubation should, however, be given, although in time organisms other than the one sought will ultimately traverse the sand stratum. In all cases the identity of the typhoid bacillus should be confirmed by the usual reactions. The method is specially useful for detecting "typhoid carriers" among those who are apparently healthy.—*P. Carnot and H. Weill-Halle (Comptes rend., 1915, 160, 148, through Pharmaceutical Journal.)*

## Section on Commercial Interests

Papers Presented at the Sixty-Third Annual Convention

### MINUTES OF THE SECTION ON COMMERCIAL INTERESTS HELD AT SAN FRANCISCO, CAL., AUGUST 11, 1915.\*

#### FIRST SESSION.

The Section on Commercial Interests of the American Pharmaceutical Association was called to order at 10 o'clock in the Gold Room of Bellevue Hotel. Chairman E. H. Thiesing presiding, and J. C. McGee, of Jackson, Miss., acting as Secretary.

Chairman Thiesing announced as the first paper on the program, "Individuality in Advertising," by Dr. William C. Alpers. The contribution was accompanied by illustrated advertisements. After discussing the paper, it was referred for publication.

The next paper of the program entitled, "Overstocking of the Retail Drug Business," was presented by Mr. J. W. England, and follows:

#### OVERSTOCKING IN THE RETAIL DRUG BUSINESS.

J. W. ENGLAND.

The commercial value of a business depends upon the amount of its net profits in relation to the capital invested, and the net profits depend, in the final analysis, not only upon the skill exercised in buying stock, but also, upon the rapidity and completeness with which the stock is turned. That stock which is the most frequently sold and renewed yields the largest ultimate profit, all conditions being equal, and often when the conditions are not equal. Thus, if a stock of \$100.00 of an article is sold on the basis of a 5% profit, and is turned over four times a year, it will yield much less annual return than the same stock sold at the same percentage of profit, turned over six times a year. Or, to be more specific, the first series of sales would net \$20.00 profit a year and the second \$30.00, or 50% more.

Multiply the turnovers and the net profits will be multiplied also. This is the basic principal of the department store business. Obviously, such a policy has a certain, but by no means complete, application in the retail drug business. The general public does not care to buy drugs of all kinds simply because they are cheap. Croton oil, tartar emetic, and ipecac, for example, somehow or other do not appeal to the bargain hunter, even if offered at "a particularly low price for this day only." And this is because the use of such drugs is exceptional, although when wanted they are wanted quickly, and this is true of many other drugs. Furthermore the public has come to know that drugs may deteriorate in quality, even when kept under the best of conditions, and they don't care to take chances. It is a case of "safety first." Hence, the number of drugs stocked by the average householder is relatively and wisely small.

But there are a large number of articles handled by the modern retail drug

\* Papers and discussions thereon will be printed in succeeding issues.

† This is printed in the minutes because it embodies a resolution and was accompanied by a communication, considered by the Section.

store which are not drugs, and have no relation to drugs, and yet which the public expects the retail druggist to supply; and these articles the public can be induced to buy, and to buy freely, by proper advertising.

It is good business policy to buy the minimum stock of slow sellers, and the maximum stock of quick sellers at the best quantity price if the stock can be turned quickly. But it is poor policy to buy largely no matter how attractive the price, if you cannot do this. Better by far, an understock of an article, than an overstock. Better an underfed baby than an overfed one; for, in a certain sense, your business should be your "baby" and be given proper diet, rest, and exercise.

The special-discount-in-quantity lots is very appealing, especially if the margin of profit is small, but the practice of taking a special discount may lead to overstocking.

Overstocking should be eternally guarded against. Market conditions—the commercial law of supply and demand—should be studied constantly, if the stock is to be kept properly balanced according to selling value.

On the other hand, in buying stock, don't adopt a penny-wise and pound-foolish policy. Use judgment in all things. Don't make too many bites of a cherry. Better by far, buy a month's or more supply of an article, than buy from day to day, or from hand to mouth. It will be more economical in the end and the profits will be greater by reason of the better prices for the larger quantity-lots purchased at one time.

Probably the chief cause of overstocking by retail druggists is oversolicitation by the representatives of the wholesale drug houses. These solicitors are *not* evils; they are necessities of the retail drug trade and they frequently give most valuable information in addition to the service they render in the booking of orders. But the service is in danger of being overdone, to the detriment of both the retailer and wholesaler. The retail druggist is being constantly oversolicited and he is being constantly overstocked; as a result, he is locking up capital unnecessarily, while the wholesale druggist is spending too much money for the solicitation of business, which expense must be added to his cost of doing business. In other words, excessive solicitation leads to economic waste.

Mr. W. A. Hover, Chairman of the Committee on Credits and Collections of the National Wholesale Druggists' Association (and Chairman of the Committee of the Denver Branch of the American Pharmaceutical Association, also), has made a careful and comprehensive study of this question. His figures show that in Nebraska and Kansas (and doubtless in other states also), the retail drug trade is called upon on an average of about ten times a month by the representatives of the wholesale druggists located within the states named, the city druggists being more frequently solicited than the country druggists. Such an extent of solicitation is unnecessary and extravagant. There is no real need for it in these days of phone and mail. One visit a month for the country druggist and one visit a week for the city druggist would be, probably, all sufficient in the large majority of cases. At other times, the mail and the phone would fill every need. In Detroit, for example, the wholesale druggists have withdrawn all their solicitors, and no impairment of service has resulted.

A proper combination of personal solicitation, mail and phone, would in no way lessen the facilities of retail druggists for quickly replenishing stock or keeping in touch with market conditions, and it would result in the material saving of time and money.

In connection with this paper, I should like to offer the following resolution and ask your consideration of the same:

WHEREAS, The oversolicitation of retail druggists for the purchase of supplies leads to overstocking and unnecessary increase of capital, with no resultant increase of net profits, and

WHEREAS, Oversolicitation can be largely eliminated by the use of the mail and phone, with, we believe, no impairment of service, but with great benefit both to the retail and wholesale druggist; therefore, be it

*Resolved*, That we, the Section on Commercial Interests of the American Pharmaceutical Association, in annual meeting assembled, hereby request the National Association of Wholesale Druggists to consider the subject of oversolicitation and overstocking, with the view of diminishing the frequency of the visits of the representatives of wholesale drug houses, standardizing the service, and advancing the interests of the retail and wholesale drug trade.

Chairman Thiesing: Gentlemen, you have heard this paper. What is your pleasure? Will you discuss the paper first and listen to the suggestions and resolutions later?

Mr. Hynson: In this connection, I have in my hands a letter from Mr. W. A. Hover, to whom Mr. England refers, along this line, and I think it would be a very valuable addition to the proceedings of this Section if this were read and included in the proceedings.

Chairman Thiesing: Suppose you read it.

Dr. Hynson: There being no objection, I will read it. I have no special interest in it, it was handed to me by Dr. Koch.

DENVER, COLO., August 4, 1915.

*Dr. Julius A. Koch:*

In compliance with your suggestion, it affords me great pleasure to submit to you the views of the jobbing drug trade as reflected by correspondence with the members of the Committee on Credits and Collections on the subject of retail credits.

In only a few sections of the United States do the reports so far received indicate favorable credit conditions. Returns to my question, "What is your percentage of loss on your gross sales by bad debts?" indicate quite a marked increase over previous five-year periods extending back to 1900. Without doubt, the percentage loss for 1914 has been the greatest in the history of the trade. The majority of our committee are agreed that this excess loss and general decline in credit conditions is due primarily to the following reasons:

First. Inadequate capital. It seems to be the ambition and desire of every drug clerk, who has accumulated or can raise a few hundred dollars, to embark in business in his own account. He, therefore, depends largely on his ability to command an excessive line of credit for his success, which in a measure is disastrous.

Second. A too large proportional investment in furniture and fixtures. The beginner with a limited capital immediately invests a large percentage of the same in furniture and fixtures, for which he pays cash or obligates himself to monthly payments, in which case he is obliged to withdraw from his business cash capital necessary for the proper conduct of the same.

Third. He invests a liberal proportion of the balance of his capital in prescription products. If his location is an outside location in our cities, or if in country towns already fully supplied with drug and prescription stocks, the returns from this investment are entirely inadequate to warrant the investment itself. In other words, one-half of the druggists in our cities are today operating their prescription department at an absolute loss; this department in many instances being a liability instead of an asset.

Fourth. After making the above-mentioned expenditures the smaller part of his remaining capital only is invested in that class of merchandise which is active and from which his profits are derived.

The result, of course, is not difficult to foresee. If he succeeds at all, it is by the use of the utmost economy and care in business management, followed by years of voluntary confinement. Many of our city stores are one-man stores, compelling a life of voluntary confinement and under conditions but little better than a term of involuntary servitude.

In the judgment of our committee, the time is approaching when our largest communities will be served by exclusive prescription pharmacists, and there will at some time be a distinction between a drug store and a pharmacy. The drug store of the future will cease to operate a prescription department. The result of this division, in our judgment, will be beneficial. It will secure greater confidence on the part of the prescribing physician and will act in a measure to restore the writing of prescriptions by physicians rather than office dis-

pensing. The public will receive better protection and the practice of pharmacy will be on a much higher plane than is now the case. Personally, I am inclined to think that a division of this kind will result in a less volume of business on the part of the pharmaceutical manufacturer and also on the part of the jobber in pharmaceutical preparations, but, as an offset, the conditions will be so materially improved as to justify the jobber in advocating economic common sense methods.

There is also another question which is deserving of attention on the part of your Commercial Section. Namely, the subject of over solicitation. There is no doubt but what the retailer is over solicited by his jobber. Almost daily calls by traveling salesmen, with the corresponding frequent deliveries of small amounts, is an extravagant and wasteful method of distribution, for which the retailer has eventually to pay. Two years ago I made a survey of conditions in Kansas and Nebraska. I found, as a result of this survey, that out of 32 towns of two thousand population and over in the State of Nebraska, the druggists in these towns were solicited 227 times each thirty days, or seven times for each druggist each calendar month. Eliminating Saturday and Sunday, as there is but very little solicitation on Saturday the survey in the State of Kansas, covering 62 towns of two thousand and over, is as follows: The total number of calls each calendar month was 704. The average number of calls in each town was 11.4 every thirty days, or about one every two days, not including Saturdays and Sundays. This, of course, means that in the same town and on the same day there would sometimes be two or more solicitors representing as many different houses. This is not a good thing for the retailer; absorbing, as it does, his time and attention and inducing him at times to over-buy or to buy goods for which he has little or no demand. It materially reduces the amount of his individual orders, oftentimes to his detriment in buying. The result has largely increased over-head expenses on the part of the jobber, both in the matter of house force and traveling service, for which the retailer is eventually obliged to pay. A certain amount of representation on the road by the jobber is necessary and desirable, both in the interest of the retailer and of his jobbing distributor. Competition, however, has brought about a condition at this time, the result of which is an unnecessary and extravagant duplication of service which is of no economic value whatsoever. If your Commercial Section can but realize the importance of this subject to your membership, you will, I think, heartily endorse and encourage an effort on the part of the jobbing drug trade to correct this manifest evil.

I sincerely trust that in the foregoing I have covered your expressed wishes and I am greatly in hopes that your Council may take such action in the matter as will be helpful to the wholesale druggist in his efforts to assist and be of benefit to you.

Sincerely, and with best wishes, I beg to remain,

(Signed) W. A. HOVER.

Chairman Thiesing: You offer that as a paper over Mr. Hover's signature?

Mr. Hynson: Yes.

Chairman Thiesing: Now, gentlemen, the paper is open for discussion. We will consider the two papers at one time, or at least that portion of it that refers to the overstocking and the service of the jobbing houses.

Mr. Hynson: I move that this paper be accepted and passed to the Publication Committee with favorable comment, and that this resolution offered by Mr. England be adopted as the sense of the Commercial Section of the American Pharmaceutical Association.

(Motion seconded.)

#### DISCUSSION.

Chairman Thiesing: There is much to that resolution. The cost of doing business with the jobbing houses seems to run somewhere between 11 and 14 percent, and no doubt much of it is attributable to the cost of getting the business. My attention has been drawn to that through a company that has been formed among the retail druggists of Cincinnati, and during 1914, the report of January 1st showed that we had done \$450,000 worth of business

that year among 150 men. That would be an average of over \$3,000 per man; and there is not a salesman on the road, and this business was done at a cost of doing business of less than 5 percent. I have not the figures exactly, but I think it was 4.92 percent. Now, when you sell an average of \$3,000 to 150 men during the year, without a salesman, it goes to show that the expense of that service on the part of the jobbers is really beyond reason, and no doubt runs their cost of doing business up considerably.

Mr. Zeig: Is that a general jobbing service?

Chairman Thiesing: That is a general jobbing service. The delivery is paid for by the retailer. The goods are delivered to him at the cost to the firm plus overhead expense.

Mr. Osseward: Mr. Chairman, in connection with soliciting, about two years ago I established a little system. I told my head man—"From today on I want you to telephone the order to the jobbing house every morning at 8 o'clock." One solicitor would come around at 9 o'clock, another at 10. What was the result? We would not get the goods until late in the afternoon. When we telephoned our order in at 8 o'clock in the morning we would get the goods in the store by 10 o'clock. At first the jobbing house wanted to know what was the trouble; they thought something was wrong. I went down and explained to them. I told them that our time was too valuable to bother with the solicitor. I told them they got the business anyway and that it would save time to them as well as to us. They were very much pleased, and we have not had a solicitor from the jobbing house in our place since we started, and we get the goods in by 10 o'clock in the morning.

Mr. Thiesing: A further source of adding expense to the jobbing house is the extended credit given of from four to six weeks. In this company I speak of, our credit time is one week, and the men found after they once started that system, that it is just as convenient to pay at the end of one week as it is to pay at the end of four weeks, or to extend the time to six weeks.

Mr. Becker: I have had considerable experience in a department store in Chicago. We were right in the heart of the city, and we did a business of between \$250,000 and \$300,000 a year on an average stock of \$25,000. We were right there in the market and had advantages. We did it in this way: We kept track of our stock. We had a card system. On every shelf there was a card which told the normal stock of the goods. Take cough syrups, we carried a normal stock of a proprietary of a sixth of a dozen. On the 50-cent size our stock was half a dozen; on the 25-cent size, a half a dozen. After watching the purchase and sales, I found the dollar size was not called for any more. I immediately eliminated that and discontinued it. I followed that same thing all the way through with syringes, hot-water bottles, razor strops and everything. We always used this system with reference to old merchandise: If we had a certain quality or size of hot-water bottles, we did not know whether a hot-water bottle had been on the shelf one week or six months. Then we adopted a way of marking them. It was a very simple system. All the department stores have this method. Say this is the tenth year of their business. In the month of January, they buy a dozen hot-water bottles, they are marked "A-10." A stands for the first month of the year, and it is the tenth year they are in business. Those bought in July are marked "F-10." A salesman of a hot-water bottle finds one is marked "A-10" and another "F-10." "A-10" is the one to sell, because that has been on hand six months longer than the other.

Mr. Thiesing: Another method of marking that was brought out at the meeting in Detroit was to take the number of days in the year and mark the article with the number of the day of the year.

Mr. Thiesing: Gentlemen, are you ready for the question?

The motion adopting the resolution and reference of the paper to Publication Committee was carried.

Mr. Thiesing: We will pass on to the next paper, "Arranging and Indexing Stock to Promote Sales and Improve Service," by Maurice P. Schwartz. I will ask the Secretary to read that. (Read, discussed and referred.)

The next paper was by William J. Lowry, Jr., entitled, "An Eight-Barreled Moth Ball Sale," on which the same action was taken, as also on the

following: "The Circulating Library as a Side-Line for Druggists," by Franklin M. Apple; "Advertising the Prescription Department," by Addison Dimmitt; "Possibility of a National Line of Non-Secrets to be Prepared by the Individual Druggist, but with Common Ownership of Copyrighted Labels," by Theodore D. Wetterstroem.

After considerable discussion of the latter paper, it was voted that the Section on Commercial Interests recommends the appointment of a committee to investigate in all its phases the possibility of creating a national line of non-secrets to be prepared by individual druggists with common ownership of copyrighted labels.

The following papers were read by title: "Our Own Make Non-Secrets Compared with Other Makes," by Fred W. Connolly.

"A Plain Talk on Business Methods," by Benjamin F. Pritchard.

"The Possibility of a National Line of Non-Secrets," by D. N. Robin.

A motion to adjourn was made and carried.

## SECOND SESSION.

The second session of the Section on Commercial Interests was convened at 10 a. m., August 12, with Chairman Thiesing presiding and David M. Fletcher acting as Secretary.

Chairman Thiesing announced the committee on the question of the possibility of establishing a line of non-secrets, who are to report to the Commercial Section in 1916, as follows: Messrs. H. B. Se Cheverell, F. W. Nitardy and David M. Fletcher.

The following papers were then read, discussed and referred for publication:

"Perfumes—Basic Materials, Production and Selling Points," by William C. Hall.

"Some Sources of Profit as Applied to Retail Pharmacy," by A. S. Parker.

"Developing the Sale of Cigars," by Sol. A. Eckstein.

The papers announced at the prior session, contributed by Dr. A. O. Zwick and P. Henry Utech, were referred to the Section on Education and Legislation.

The election of officers resulted as follows:

Chairman—R. S. Lehman of New York.

Associates—E. H. Thiesing of Cincinnati, W. H. Cousins of Dallas, and George H. P. Lichthardt of Sacramento.

Secretary—J. C. McGee of Jackson, Miss.

The report of the Committee on the Chairman's address\* was called for, but the members being engaged in other duties the recommendations of the Chairman were by vote brought to the attention of the Section by Mr. F. H. Freericks stating—

That the first recommendation was with reference to the growing use of so-called pharmaceutical preparations placed on the market by manufacturing pharmacists, in the sense of their competing with the work of the retail pharmacist, and of entering more and more into the field of the

\* See minutes of Joint Session with Section on Education and Legislation, page 1203.

retail pharmacist, thus giving or leaving little for the retail pharmacist to do as such. The Chairman of this Section made a recommendation that there should be an effort on the part of our Association to come to an understanding with the pharmaceutical manufacturers with a view of calling a halt on the growing of their business as encroaching upon the field of the retail pharmacist, and with a view of making a limit to the extent to which they might go.

It is an exceedingly important recommendation. The recommendation was that a committee of five be appointed by the President of our Association, who would take this matter up with either the Association of Pharmaceutical Manufacturers, or with the individual pharmaceutical manufacturers. That recommendation, I do believe, deserves the hearty approval of the Section. I would move you that that recommendation for the appointment of a Committee by the President of the Association be approved by this Section and referred to the General Session.

Mr. Anderson: I second this motion, Mr. Chairman. I would like to call attention to the fact that Mr. Osseward's letter relative to certain advertisements was also referred to this Committee with the report. I believe a Committee appointed by this Association can perhaps accomplish more in regulating such advertising methods than they can in preventing these firms from putting preparations on the market. That is their business, and it is pretty hard to convince the pharmaceutical houses that they shall not put any further preparations on the market. But I think it should be referred to the Committee, and I second the motion.

Mr. Binz: I am in hearty accord with the sentiment of the Chairman, but I don't think it is possible to make any effort in that regard, because I don't think you can instruct a manufacturer what he shall do and what he shall sell and what he shall not. I think the only way this Association can have any influence at all is upon its members not being made a scapegoat for the manufacturer; but as long as the manufacturer has these goods, you cannot blame him for selling them. I think that legislation in that regard is a waste of time, because I don't think you will gain a thing by it.

Mr. Lichthardt: Mr. Chairman, speaking on this resolution, I am in favor of it if it will do any good. I think the trouble lies with the retail pharmacists themselves. They sell the goods. Coming to the subject of co-operation, the retail pharmacists of the United States, 45,000 of them could do something if they would get together and refuse to do this or that, and these people would come to them. That is the trouble. We are a house divided among ourselves. For a Committee to go to manufacturers and ask them to refrain from putting out this or that preparation I think will do very little good. We should come together and refuse to stock those goods and they would have to quit manufacturing them. I don't think the other channels of trade would sell enough of that class of goods to make the manufacture of them by those pharmaceutical houses profitable. Again, I say I am in accord with anything that will better the status and condition, especially the financial condition, of the pharmacists throughout the United States. The pharmacist is very poorly paid for his work and investment, and I would vote for such a recommendation, but I am afraid it won't do much good.

(Dr. Claus then took the chair at the request of Chairman Thiesing.)

Mr. Thiesing: In reference to the recommendation, I would say that the idea or intent of the recommendation is not fully understood. I referred more particularly to pharmacopoeial preparations. We don't ask them to refrain from manufacturing or from selling remedies, but we ask them to refrain from inducing physicians to specify brands of official preparations such as Johnson's Elixir of Iron, Quinine and Strychnine, when the retail pharmacist should have a right to manufacture it himself. In that way, the retailer is deprived of the opportunity of using his skill and knowledge in preparing such elixir and he is compelled to carry many brands in stock. It is that class of articles that we ask them not to refrain from selling but to refrain from inducing the physician to prescribe that particular brand of a preparation.

Mr. Binz: Then I think the proper course to pursue would be to instruct the physician and let your druggist manufacture it. The physician should not prescribe or specify that particular brand. It is the physician that is to blame in that case and not the proprietary house. The proprietary man cannot be blamed for putting up his preparation. If you don't want the physicians to specify such things, you must get them not to do so.

Mr. Thiesing: The manufacturing houses cater to the retail druggist, and he is willing to make a few concessions, and while he manufactures many other things that he can get them to specify, I think some test should be made.

Mr. Freericks: In line with what Mr. Thiesing says, it seems to me that this is opening up a very broad question. If a committee is appointed by the Association, to open up this matter, it will have to go into that generally. It will have to revise its plans and it must be informed of the objections that are pointed out. Having done that, it can arrive at some basis that will appear reasonable to them. It may not appear reasonable to manufacturing houses, but there is nothing on earth like mutual understanding and like seeking to arrive at a mutual understanding. I can see in this recommendation of the Chairman, if it is properly taken up and carried out, an opportunity for pharmacy in this country. I believe that the manufacturing pharmacists in this country have a true interest in retail pharmacy, and while they are, of course, in business for money—everybody is—they are willing to concede, as far as it does not interfere with their business, the rights of the retail pharmacist.

I do hope that this recommendation will prevail.

Dr. Claus: Is there any further discussion? I will ask Mr. Freericks to put that question again.

Mr. Freericks: The recommendation was that the Association appoint a committee of five whose duty it is to make an understanding with the manufacturing pharmacists as to the line of goods that they are to put out in competition with retail pharmacists, and as to the effort they are to make in the matter of ordering the sale of pharmacopœial and N. F. preparations. That I think in substance is the recommendation.

(The motion was put and carried.)

Mr. Freericks: The other recommendation that I find in the Chairman's address is that, together with the Section on Practical Pharmacy and Dispensing, we arrange for the appointment of a committee of five who are to take up the work of interesting the dispensing physician in legitimate pharmacy by a national effort undertaken on the part of the American Pharmaceutical Association; the outline of the plan being that this Committee should take one large city and one small city in the country and commence its work in that way, impressing upon the local men that the work is a national work undertaken by the American Pharmaceutical Association, and particularly impressing this upon the dispensing physician in those cities, making it purely an educational campaign. I move that that recommendation be approved.

Mr. Anderson: I second the motion.

(The motion was put and carried.)

Mr. Thiesing then resumed the Chair and presided.)

Chairman Thiesing: Is there any further business? If not, a motion to adjourn sine die is in order.

The motion was made, seconded and carried.

## ADVERTISING THE PRESCRIPTION DEPARTMENT.\*

---

ADDISON DIMMITT, LOUISVILLE, KY.

---

Publicity is absolutely necessary to the success of a prescription business.

The old idea that a prescription department or case should be a place of mystery, bad odors and dirt, probably shut off in a badly-lighted and ventilated corner of the drug store, should be a thing of the past. Such places, I am sorry to say, still exist and are generally found in a so-called modern, up-to-date pharmacy, which consists largely of a lunch room with department store trimmings, decorated from ceiling to floor in glaring colors, yellow predominating, with flaming advertisements and a complete line of infallible cures for all the ills that the flesh is heir to. The real drug and prescription part of the business is of so little moment that they are pushed back out of sight and nearly out of mind. On investigation you soon learn from the owner or manager that the prescription department, in most instances, is conducted at a loss. The reason is they feature cheap prices to attract the innocent, thoughtless and penurious, and are forced by their general policy to price prescriptions so close that it is impossible, even with cheap clerks and cheap competitive drugs, to make a profit.

The other kind of store where you find an indifferent prescription department usually has a lazy or incompetent druggist as owner or manager. They belong to the "ne'er-do-well" kind; think the world owes them a living and sit down and wait for it to come. Unfortunately, there are lots of these fellows. You have seen them. The atmosphere in their entire store is bad, nothing to inspire confidence. They, of course, have not a prescription business of any moment; and I might add here that it is these two classes of drug stores that cause physicians to dispense, and, by their methods, shake the confidence of the public in the druggist, thus causing the professional and ethical side to be made ridiculous. However, I am straying from my text, "Advertising the Prescription Department." I can only cite my own efforts along this line, which have been productive of very satisfactory results, as our prescription business has grown continuously and without sacrifice of principle or price.

In every community there is a large element of people who want the best both in materials and service, particularly is this true with medicine. As they know absolutely nothing about drugs and prescription service they drift to the neighboring druggist, unmindful of whether he is competent or not, to have their prescriptions filled. If results from the use of the prescription are not what was expected, the doctor is blamed. These are the people you can and do reach by straightforward advertising explaining the difference. I do not believe in sensational advertising, yet it must be sufficiently strong and individual to attract attention.

Before a druggist attempts to advertise his prescription business he must put himself in a position to make good; in other words, his material, equipment and service must be what he advertises, else his advertising will react and do him more harm than good.

---

\* Read before Section on Commercial Interests, San Francisco.

We equipped our prescription department as hereafter described, before advertising. We have two large rooms on the second floor for prescription and laboratory work, with excellent light and ventilation. This department is connected with the salesroom by two dumb waiters and speaking tubes. Both rooms are finished in white enamel cases, ceiling and walls, and all work tables and shelves are of white Belgian glass; special ointment case; special refrigeration. Our laboratory is furnished in white, the same as our prescription room; in fact, we have worked out every detail so as to make our department complete and the best to be found.

We consider this one of the best advertisements for a druggist who desires to do a prescription business. We made it a point to take every physician in our city up to our department and explain its details thoroughly; we have also taken newspaper men and some of our appreciative customers.

We had photographs taken of the room and from them good engravings made. We then issued a small illustrated booklet, descriptive of our equipment, material and service. These we mailed to each physician of our city and vicinity. Many complimentary remarks followed. Since then we have printed a small-sized edition and wrap one in every prescription we fill. We find this a most excellent advertising medium and one that brings results.

Now a word as to the character of the men entrusted with prescription work. We select good men, pay them well and demand efficiency. Our men are all graduates in pharmacy, three of them being honor men of their graduating classes. Our head prescriptionist is a competent chemist. He has general supervision of the prescription room and does the laboratory work, particularly the assaying. Owing to our having competent men and equipment in this department, we supply virtually all of the physicians' laboratories in our city with their stains, reagents, special sterile solutions, etc. We find this is not only remunerative but also an excellent advertisement, thus securing the co-operation of the physicians for a good, profitable prescription business. A word from him to his patient carries more weight than anything we might say.

This brings us to the third and a most important consideration in developing a successful prescription business; that is, the material. We have for years and do now feature the chemicals and pharmaceuticals prepared by well-known manufacturers. This is not written as an advertisement for that firm, but I am trying to show what I believe has contributed largely to the growth and success of our business. This firm has been known favorably for years to the medical profession and their name is an asset; and as they market only one grade of products of highest purity, we feature this fact in our advertisements, both to the medical profession as well as the public. We say in our advertisements that when a physician does not specify a particular make of chemical, we use the best, which means a definite dose and definite results.

Now, as to advertising your prescription business to the laity. We do so without jeopardizing our standing with the medical profession. Some of our newspaper advertisements may border on the sensational, but experience has proven that it takes strong, well-spaced paragraphs to get pronounced results. We use three of our daily papers once or twice a week, three or four columns wide and from eight to twelve inches long. We try always to get the top corner

of page devoted to local society, believing that advertisements are read more by women than men. While the nature of our ads were such that there were no immediate results, yet in a short time we were getting prescriptions from all parts of the city. I attribute this largely to publicity by newspapers. I will give a few of the leading paragraphs we used in talking to the public through the paper; the headings indicate the character of reading matter that followed:

"It is better to have Newman fill your prescriptions than wish you had."

"Newman's rigid inspections assure purity and strength in their Drugs."

"Purity, Accuracy and Promptness—our three watchwords."

"Reason with yourself. Did you ever get something for nothing that was of real value?"

"Are you giving the sick one the best possible chance for recovery?"

"Suppose a cheap, ignorant drug clerk gave you Morphine when you asked for Quinine. Newman's skilled men can fill your prescriptions no matter how difficult others may find them."

"Highest Quality and lowest prices are as congenial as fire and water."

"Why do you go to your favorite Doctor?"

"Your life or the life of some loved one may depend on the man behind the prescription counter."

"A heart to heart talk on a subject that concerns you."

"You insure against fire, wind and water; also your life against death and accidents, then why not get prescription insurance at Newman's?"

"Confidence after all is the keynote to any successful business."

"Don't juggle with your health."

"Block signal service at Newman's with our checking system."

Newman's white enameled prescription department is as spotless and sanitary as a hospital or operating room."

"Attention to detail—NO SUBSTITUTION—These factors have made our prescription department famous."

"See your Doctor, then see us."

"We fully realize that every minute counts in time of sickness—that is why we use Motorcycle Delivery."

The following are a few paragraphs we use both in the body of counter booklets, as well as newspaper talks:

"Our prescription department is furnished with every scientific apparatus known for insuring accuracy and rapidity in preparing prescriptions, highly sensitive scales, electric sterilizing closet, tablet machine, suppository moulds, cachet machines, and numerous other modern appliances to facilitate and improve prescription work."

"All prescriptions filled by us are delivered in sealed packages, be they liquids, powders, pills or capsules; sealing strip is placed around each, thus insuring to the patient that it has not been opened or tampered with from the time it leaves the prescription department until it is opened by the owner."

"Instant dismissal is the penalty for substitution by any of our clerks; every man in our employ understands this thoroughly."

"Our guarantee label which is affixed to every prescription prepared at our place means just what it states. Kindly read it."

"All directions on prescriptions prepared at our place are typewritten, leaving no doubt in the mind of the patient as to the doctor's instructions."

"All pills, capsules, powders and suppositories are dispensed in hinged-top boxes, thus preventing the interchanging of covers, which lessens the liability of a serious error."

"The price of a prescription depends on the nature and purity of the drugs that

go into it, also the character and qualifications of the man who dispenses it. Our prices are based on the highest quality of ingredients and the most competent service. It is worth the difference; ask your doctor."

"All ointments or salves dispensed by us are placed in antiseptic collapsible tubes and the tubes in a substantial box, thus insuring freedom from exposure, which frequently causes ointments to become rancid and inert. Also protects the ointment from dirt or other foreign substance which may cause re-infection."

"Every one knows how sensitive the eye is—that if the least particle of dirt or dust gets into it, particularly if it is affected, how serious it is. To avoid just such thing occurring, we dispense all eye drops in a strong box in which the medicine and dropper can be perfectly protected."

"New bottles, new corks, new boxes, new labels, all scrupulously clean, are used for each prescription whether it be a re-fill or not."

"With us, prescription compounding is the most important work we do and we exercise every care and precaution to do it right."

"The Newman Drug Company's prescription department is located on the second floor, absolutely away from the noise and interruptions found in the sales department of all stores, and our prescription clerks do nothing else but fill prescriptions."

"We employ only highly educated pharmacists to compound prescriptions, men who are absolutely dependable, clean morally and physically, whose entire time, mind and energy is concentrated on their work; no distraction, no interference, as they are away from all possible interruption. This is an added safeguard against errors."

"Every United States Pharmacopœia and National Formulary product we manufacture in our laboratory has the Government tests for purity and accuracy applied. A record is kept with a control number, so we know, and can positively state, that all of our products are up to the required standards of strength and purity required by the National and State Pure Food and Drug Laws."

"Our firm buys and dispenses nothing but the best, irrespective of cost. We never substitute one product for another, claiming that it is 'just as good.' We never misrepresent an article, nor do we attempt to divert a customer from what he wants and asks for. We cannot and do not recommend patent medicines. We do not counter-prescribe, for that is absolutely the physician's field, not the druggist's. We do not permit our name or our place of business to be used to endorse or exploit fake medicines."

In conclusion would say perhaps I have offered no new ideas or thrown any light on this much-discussed subject, yet what I have written and have accomplished in this field is based on my own experience. I have pride in my calling and it has been my ambition to develop the professional and ethical side, thus to command and demand the respect of my fellowmen.

#### DISCUSSION.

Mr. Osseward: This paper again goes to show that it is possible to combine adequate pharmacy, and, as I call it, applied commercial pharmacy with merchandising. There seems to be a wrong idea prevalent that because a man runs a purely prescription store he should be opposed to commercial pharmacy. Such is not the case. If one man wishes to run a commercial pharmacy, so-called, if he wants to do merchandising, that is his business. All we ask from our side is that they give at least as much attention to the prescription department as they do to the merchandising, and they will find if they are persistent in giving it the right attention that they will get fully as much profit out of the prescription department as they will out of any other department. That is my contention.

Mr. Nitardy: One thing I was pleased to note is that the firm uses collapsible tubes for ointment. That is one of my hobbies. We do that in Denver.

Mr. Thiesing: Do you make an added charge for this?

Mr. Nitardy: Yes; we get a better price. It costs us from five to ten cents for the package. We use quarter ounce, half ounce, two ounce, three ounce and four ounce collapsible tubes, and our tubes are labeled on the sides. Some are red, some are yellow and some are blue, and the hinged boxes are labeled with corresponding colors of paper, so when two ointments of the same quantity are prescribed, the patient will readily distinguish between the two and not put the ointment back into the wrong box. You cannot put the label on collapsible tubes that will remain for any length of time. At first it is all right, but later they begin to roll up on the tube and the label becomes obliterated or destroyed, and we use that color scheme as a precautionary measure.

Mr. Thiesing: How much do you ask for a one ounce prescription of an inexpensive ointment?

Mr. Nitardy: It would be very difficult for me to answer that question, because I am not in touch with the prescription department sufficiently to know. But I know it was decided by the firm to increase the price of ointments all the way through in view of the higher price of the package, and we have had no complaints so far as I know. Take a one ounce tube in an ounce hinged lid box—it looks larger than a one ounce jar of ointment. The patient thinks he is getting more for his money because it is a larger package. It also looks more "classy," to use a slang expression.

I want to make another statement: On the inside cover of the box we have printed a little matter regarding the reason for using collapsible tubes, stating that the ointment jar is not a very sanitary container, and the object of the tube is to furnish a cleanly package, and that the tube affords better protection against air, dust, other contamination and light, than a jar.

Mr. Thiesing: I have always been of the impression that druggists, as a rule, do not charge enough for ointments dispensed, that is, ointments properly prepared that are put out as pharmaceutical preparations and that you would offer for inspection. We have given that a great deal of thought. We add from ten to fifteen cents and for an ointment of that kind we get fifty cents.

Mr. Nitardy: That is what we get.

Mr. Thiesing: And that covers overhead. I read your article about the prescription and the 27 percent profit.

Mr. Nitardy: Those were answers received from 10,000 prescriptions in ten different stores, and they represent, I imagine, an average of the profit made by Colorado druggists on prescriptions.

Mr. Thiesing: It seems to me so remarkably low, in view of the average cost of the work.

Mr. Osseward: In connection with that, it takes a great deal of time to prepare ointments properly, and I believe the pharmacist is entitled to a good profit. Take it in eye ointment, if we get a two drachm eye ointment with a collapsible tube and hinged box, we cannot charge less than fifty cents. If the ingredients are the same, it is the skilled labor you have to charge for. You are paying for it, and you ought to make a profit on your labor. We had an instance of that the other day. A doctor ordered some ointment, and he even directed it to be put in a tube; but the druggist failed to comply with the request, even was careless in the preparation of the ointment. The physician discovered the defect and by rubbing a little on the palm of his hand showed the patient the reason for the irritation that had been caused. Then the patient came to us. We charged, I think, fifteen cents more than the other store did, but we got that extra money for doing it right. This goes to show that you can get the extra price if you do the work. The physicians stand behind you.

Mr. Se Cheverell: The Chairman made a statement referring to our Colorado prescription prices, that your scale runs a little bit ahead. Have you ever made a systematic check on the prescription business the same as we did in Colorado this year?

Mr. Thiesing: No.

Mr. Se Cheverell: I venture the assertion— not that I am questioning your judgment—that on the positive, right-down-to-the-cent check, that you will be as greatly surprised as many of us were in Denver when we finished our final checking; and as a result of that the

most of us have added five to ten and in some places fifteen cents more to our prescription prices right straight through. We thought we were charging enough, but when we got right down to bedrock, figuring every item of expense, we were very much surprised at the small margin of profit on which we were carrying our prescriptions.

Mr. Nitardy: I would like to add one word. We found that while there was uniformity in prices charged, there was a great deal of discrepancy in the estimation of overhead expenses. We found the men that were the most careful got the highest figure on overhead for some reason or other. I believe that the average druggist does not take the time to calculate what it costs him for rent and telephone service and light and heat and waste and cost of investment, and such waste as is included in buying the preparation and then never selling any more of it, after the first prescription, and the skilled labor that you have to employ, and your breakage of glass ware, and the equipment you have to carry to run a respectable prescription department, and consider that on the basis of the number of prescriptions you fill. If you consider all those items you will find that the overhead amounts to a great deal larger percentage than the average cost of doing business.

Then there is another consideration I believe the average pharmacist overlooks. When you figure all that overhead of the prescription department—you only arrive at the cost without the running expenses, for the reason that when the prescription is filled, when you have paid the expenses of the prescription department, you have only a finished, salable article of merchandise just like a patent medicine on the shelf that your customer comes in for, and you hand to him. There may be risks of accounts in the prescription department, and the losses on the prescription department accounts are greater than at any other end of the store, for the reason that we are all human, and when a hard luck story is put up, we will let a man have a prescription where we would not let him have anything else. It takes study to figure out what it really costs you, and you will be surprised if you calculate what it costs you to fill your prescriptions. You will find that you make an average gross profit just like the people in Colorado, of about thirteen cents a prescription.

Mr. Thiesing: There is much in what Mr. Nitardy says, and no doubt it would figure out that way. In regard to part bottles of preparations, I had occasion to rearrange that part of our stock a month or two ago, and I was surprised to find that we had 327 bottles of patent medicine or proprietary medicine open. That does not take in the malt preparations.

Mr. Cody: I would like to ask a question in regard to pricemarks. We have pricemarks in several states, and I would like to ask if the eastern states would adhere to those prices.

Mr. Osseward: I am glad the gentleman brought that question up. I find in ten cases where we get a prescription, the price is marked on two. I find, as a rule, that the prices charged east are ridiculously low; you could not make a living; you could not pay the help and put up prescriptions for those prices. I had a lady the other day who came from the east, and when she asked me what the prescription was worth put up, I told her, and she replied that she paid half the price at home. I said, "Lady, you take it back, take the train, and have it filled."

Mr. Nitardy: There is a resolution before the House of Delegates this year, requesting that the American Pharmaceutical Association appoint a committee of five to investigate the cost of prescriptions in various parts of the country, and the retail prices received for these prescriptions on a somewhat similar basis as was done by the Colorado Pharmaceutical Association this year. A similar request has been sent to the N. A. R. D., so that all over the country a campaign of investigation can be carried on during the coming year in regard to this very vital and important subject, this committee to report back to this Association next year with a statement of what the committee believes should be the proper gross profit made on prescriptions. When that is done, we will have a basis on which to work in harmony all over the country as to what we ought to get for prescriptions. I am sure that most druggists that have only a moderate prescription business are losing money on every prescription they fill. Only those with large prescription businesses make a fair or small percent of profit or break even. There are very few druggists in this country today who are really making any profit on prescription business, and that is one of the reasons why the

drug profession, as a whole has such poor financial strength. We are not placing any value on our service; we are trying to charge a profit on the material we supply. I know from experience that the average druggist figures this way: He takes an article, say a certain amount of drugs that cost twenty-five cents, and he doubles that, figuring he wants to make 100 percent; he throws in gratis the container, the label, the work, whatever is necessary to his service, overhead expenses and everything else. That is all free. As a result, he never figures out that the things he gives free reduce his profit on the material that he is selling.

Mr. Osseward: There are not very many prescriptions on which you are making money. My average prescription, with the man I had in my store two years ago, cost  $23\frac{1}{2}$  cents expense. Last year, it cost me 23 cents. Every year I learn what it costs. When I take stock, I figure up my result. I find that I have filled so many prescriptions. I deduct a certain percentage for biologics, and things like that, but my total expense of the year is divided by the number of prescriptions that have been dispensed, and I call it my expense account. In other words, the expense of doing business with us this year will be based on 22 cents for each prescription.

Mr. Cody: Physicians are largely to blame for this condition. I now speak more of country stores than city stores. City stores are large and you have a transient trade. In the country you don't have that. They will pay fifty cents for a prescription here and pay another price somewhere else. A patient will say to a doctor, "What do you think that ought to cost me?" The doctor will say, "Oh, that ought not to cost you more than so much." And the doctor is just as liable to order something that costs us ten or eleven dollars a bottle, and tell the patient that he ought to get it for a dollar. That is a condition which has an effect on us.

Mr. Osseward: I would advise you to try a little education among the physicians. I think a heart-to-heart talk with the physicians about giving prices to their patients would improve matters. Just ask the doctor to tell his patient that he doesn't know anything about prices. I have a physician now who invariably will prescribe proprietary medicines. Whenever he prescribes he will tell the patient, "You will have to pay a good deal for that because it is expensive." It makes a good feeling all around. The patient expects to pay a good price, and he does not complain.

Mr. Cody: If the doctor writes for a bottle of any patent medicine, sarsaparilla, or anything else, and says, "Use according to the directions on the bottle," I simply pass over the bottle and charge the same as if there was no prescription; but if it needs a new direction on it and we have to wash off the label, we charge an additional amount.

Mr. Nitardy: The service is worth that, but we don't want to get the wrong deal on it. Our firm has always looked upon that as not very good business policy. When we sell a proprietary medicine in the original bottle, and the patient will know what it is, we get the same price as if they simply called for the preparation. As a matter of policy, we have always done that. If the doctor prescribes a pint bottle of mineral oil, just that way, so the patient will know, and our price over the counter for a pint is fifty cents, that is what we get for that prescription. We make no extra price because we don't like to have the people think we charge more just because the preparation is called for on a prescription.

## Commercial Section and Section on Education and Legislation

### PROCEEDINGS OF THE JOINT SESSION OF THE COMMERCIAL SECTION AND SECTION ON EDUCATION AND LEGISLATION.\*

The Joint Session of the Commercial Section and Section on Education and Legislation was held in the Gold Room of the Bellevue Hotel, San Francisco, California, Tuesday, August 10, at 2 o'clock p. m., with Chairman Frank H. Freericks, Chairman of the Section on Education and Legislation, and Chairman Edward H. Thiesing, of the Commercial Section, presiding. In the absence of Secretary R. A. Kuever, Clarence McKellips acted as Secretary pro tem.

Chairman Frank H. Freericks, after calling the meeting to order, said: In the absence of the Secretaries of the two sections, Prof. Clarence McKellips has agreed to act as Secretary of this meeting. I take it that that will be agreeable to all, and I might say that Chairman Thiesing will open the program with his address as Chairman of the Commercial Section.

#### CHAIRMAN THIESING'S ADDRESS.

It was with some misgiving that the honor conferred upon me last year was accepted, and I trust that my shortcomings as Chairman of this Section will not be ascribed to an unwillingness for work. The commercial side of pharmacy and its needs are of course clear enough to all pharmacists, but to make the most of Section work both experience in it and a large acquaintance among our members is a very desirable adjunct.

The commercial side of pharmacy has always vastly interested me: not alone on its own account but as an essential to the progress of the art and science. The love for true pharmacy need not be alone dependent upon material welfare, and yet if my experience and observation may be a criterion, it does look to me that the man weighed down with the care of meeting obligations is but little disposed to regard pharmacy aside from his own concerns or to give thought for its general advancement and improvement. The cause of retail pharmacy, in my judgment, is intimately connected with its commercial side and features.

With all due consideration for the opinion of those who are interested in pharmacy only as an art and science, my patience is taxed when they would ignore the business part of the drug store and belittle the many side-lines which have come to find a place in it. Honest business when not altogether foreign, in the accustomed sense, in no manner discredits pharmacy, and many a man has found opportunity to be of service to it only because of the profits realized from the commercial adjuncts to his American Drug Store. We must accept conditions as we find them and work for their improvement. This Association, deeply concerned with pharmacy as a profession, would poorly serve its purpose if it failed to consider the commercial problems, and to help solve them so that the one may be reconciled with the other and hand in hand lead to higher and better things. Therefore the Commercial Section has an important place in the general

---

\*The papers presented, excepting the addresses of the Chairmen, will be printed in this or succeeding issues and be accompanied by the discussions.

affairs and arrangement of our Association. I earnestly trust that the membership may give it even greater attention and thought, especially since it represents an activity which distinctly upholds the retail pharmacists whose interest and work should be maintained and increased.

The retail drug business is not and has not for years been in a very desirable condition. With prices demoralized very generally in the large communities on articles of a proprietary nature, prices have been reduced to a minimum on fully half of what is sold in the drug stores. With an evergrowing output of pharmaceutical products by manufacturing houses, the opportunity for exercising pharmaceutical skill and knowledge is constantly growing less. With greater inroads on the legitimate field of the retail pharmacist by dispensing physicians and more especially by those who cater to the latter, the troubles of the pharmacists are many. It is to these and their possible alleviation that I would ask your attention.

Pharmaceutical work in the drug stores offers many opportunities that are wasted to-day by many retail pharmacists. Products which they can well prepare are bought because of expediency and lack of initiative. Some even buy pharmaceutical preparations. Regardless of the fact that such methods do not justify the claim of being a retail pharmacist, such lack of correct pharmaceutical endeavor is usually a lost opportunity for profit.

Pharmaceutical skill whether exercised in the manufacturing laboratory or in the retail shop must be paid for and constitutes a part of the cost of the finished product. Of course the manufacture on a large scale of some products can be done at greatly reduced cost, and lower than is possible for the retail pharmacist; many, however, can be manufactured by retail pharmacists at a profit. In the cause of retail pharmacy we should try to reach every retail pharmacist and endeavor to create in him a greater interest and pride to supply his own needs, whenever possible, in the manufacture of pharmaceutical products. The work on the part of retail pharmacists may be profitably extended to a line of non-secrets for serving household purposes. These ordinary and self-evident thoughts, if taken to heart and acted upon, will increase the profits of every average drug store and will advance the art of pharmacy. To arouse a greater interest in work of this kind appears particularly to be the mission of State Pharmaceutical Associations.

#### THE MANUFACTURE OF PHARMACEUTICAL PRODUCTS.

It is not alone the growing neglect of the retail pharmacists to use their pharmaceutical skill which tends to make business conditions so unfortunate, but the manufacturers of pharmaceutical products have much to do with present day conditions confronting retail pharmacy. Needless to say, the manufacturers may well contend that they fill only the wants as they exist, but really do they not create wants without need, against the best interests of the retail pharmacists whom at the same time they desire to retain as customers?

Is it fair for manufacturing houses to continually burden the market with new preparations, adding nothing to the merit of such as already exist? Is it fair to Retail Pharmacy for manufacturing houses to detail physicians and encourage the use by them of special brand products, which are often without added good for either physician or patient, over the recognized preparations of the Pharmacopoeia and National Formulary, and which every pharmacist should have an opportunity to make and supply? It cannot be denied that the present methods of business as pursued by pharmaceutical manufacturers have an immediate effect upon and tend greatly to injure retail pharmacy. For myself, I am rather inclined to believe that aside from the prospect of money return and of profit, most if not all of our pharmaceutical houses have an altruistic interest in Pharmacy. They, I believe, want retail pharmacy to continue as such and would truly regret its extinction. Of course, we may not expect and may not hope that the manufacturing pharmacist will undo himself, to maintain the retail pharmacist, but

may we not at least endeavor to secure an understanding which will satisfy the one and serve the other? It seems to me that something must be done in the interest of Commercial Pharmacy to save Professional Pharmacy for the retailer. Can we not arrive at an agreement which will mark the line of operation between the correct business endeavor of the manufacturing pharmacist and the retail pharmacist? My very high regard for those engaged in manufacturing pharmacy induces me to advocate, that such an agreement and mutual understanding be sought. To that end I recommend the appointment of a committee of five retail pharmacists to give thought and study to the problem and to take it up with manufacturing pharmacists or their accredited representatives.

#### THE DISPENSING PHYSICIAN.

Possibly no other obstacle to retail pharmacy can compare with the one caused by dispensing physicians. It very materially affects every retail pharmacist, and as a rule to the disadvantage and injury of the patient. We must grant that dispensing physicians as a whole will not agree to our claim that they disregard the best interests of their patients. We must allow also that frequently, from their point of view, they may reasonably have ground for such prostitution of their profession, and the difficulties are by no means one-sided. As I reflect upon the growth of the dispensing evil by physicians, as it has grown in the course of years in my community, (which no doubt is equally applicable elsewhere), I come to doubt that this problem has been properly handled by retail pharmacists. There is certainly a total lack of understanding or of an effort at such understanding. The evil has become so thoroughly rooted that it is hardly within the possibility for individual pharmacists to successfully attack it. Its uprooting, if at all possible to accomplish, must depend upon well directed, intelligent and organized effort. The attack to be successful must be upon the highest and most broad-minded plane; it must be primarily of an educational nature. It seems to me that the American Pharmaceutical Association is best equipped for resultful work along this line. At least it is worth an attempt and I urge its making.

Without taking too much time in an elaborate discussion, I submit as a possible and practical way for approaching this subject, the following: Through a suitable committee representing both the Section on Practical Pharmacy and Dispensing and the Commercial Section, I would formulate plans for reaching all the dispensing physicians of one fairly large city and of one smaller city, and would at first center all the energies on these selected cities. This should be undertaken by and with the co-operation of our local members. After a most thorough study and formulation of complete plans, the committee having secured a complete list of the dispensing physicians in these cities, should make it a personal matter with each of them, acting for the American Pharmaceutical Association.

It may be that I am mistaken, but I do believe that an intelligent approach of the average dispensing physician along high and educational lines will have beneficent results for the good of pharmacy and for the public well-being. This is submitted merely as a thought, and I hesitate to make of it a positive recommendation, preferring that such be left for decision by those better prepared to arrive at a correct conclusion.

In closing I would submit for your consideration that our Journal may well give a greater part of its space to the discussion of problems and matters which concern commercially the retail pharmacist. It will be helpful to our membership who are engaged as retail pharmacists and have a tendency to enlist from among their ranks a greater number of members.

I well appreciate that the Chairman's address might be extended to include a discussion of details and special features which would be of direct interest to the individual retail pharmacist in connection with his business, but believe that such purpose is best served by the presentation of papers and their discussion. In arranging with the Chairman of the Section on Education and Legislation for a

Joint Meeting of the two sections, we have had in mind to show that many of the activities which are now allotted to the various sections may well be brought together and be equally interesting to all in attendance. If in a measure we are successful, then our effort will be well repaid.

F. W. Nitaryd moved that the address be referred to a committee. Seconded by Mr. H. B. Se Cheverell.

Chairman Freericks then asked whether there was any discussion of the address of Chairman Thiesing and asked whether the body did not want to pass it to a committee, and possibly have a later discussion.

#### DISCUSSIONS.

Mr. Osseward stated that inasmuch as Chairman Thiesing had recommended in his address that a committee be appointed to get in touch with the manufacturers regarding many of the products which they prepared and which increased the number, that he would like to read a letter which was given to him by one of the Seattle physicians, and one which he thought would fit in with the very work of the committee.

The letter in part follows:

Dear Doctor: One of the best examples of the occasional superiority of a pharmaceutical specialty over the product of even a skilled pharmacist, following a physician's prescription, is to be found in the case of \_\_\_\_\_. Your prescription calling for \_\_\_\_\_ (contents hereafter indicated) could be filled, but the result would be neither slightly nor palatable in nine cases out of ten.

Bromoform is a splendid sedative; but there is only one way in which it may be safely administered, i. e., in solution. It is so heavy that emulsions are not practicable; and if kept in pure form it is exceedingly subject to decomposition.

Our preparation is efficient, permanent and palatable. With it you can obtain the sedative action of bromoform, in conjunction with the expectorants, ipecac, ammonium bromide and benzoïn, with safety to your little patient and without incurring his everlasting enmity on account of the "awful taste of Dr. \_\_\_\_\_'s medicine."

If you are not familiar with it let us send you a sample.

Mr. Osseward: And the doctor writes on the side of it, "Mr. Osseward, what do you think of their statement?" I for one, as a dispensing pharmacist, object to such procedure; I for one will not admit that this particular firm is so much superior to us in compounding such a preparation; and I do not believe that any other practical pharmacist would allow manufacturing concerns to assert superiority in their work.

It is not such a difficult compound to prepare; it does not seem that we are so incapable in our work in preparing a preparation of that kind, and I do not believe that a firm has a right to place such a preparation before the physician, or has a right to put such propositions to the physician, in our disfavor.

And I believe that a letter of this kind fits in very nicely with the recommendation of the Chairman to go before the manufacturer and see if we cannot get together on a middle ground so we will agree on something to prevent such as this. I do not believe it is fair for a retail druggist to carry on and out such correspondence.

Dr. W. C. Vernon then stated that he believed the retail drug trade ought to know the name of firms that are soliciting business by means of that kind of advertising; that to his mind a letter of that kind constituted a direct charge against the legally qualified and educated pharmacists of this country that they were not able to compound a prescription correctly; that in his opinion that was what the letter was meant to infer; that such attacks ought to be stopped by the retail drug trade in the same manner as a few years ago the Association had taken up the matter of detail men from pharmaceutical houses going into the homes of physicians and explaining to them that if they sent their prescriptions to the druggist they would not be compounded correctly, because substitutions would be used and that the only way they could get effects for their patient properly would be by preparing a

prescription by their or by its coined name; that it was disreputable for the houses to call attention in that manner to their detail men, to the embarrassment of the pharmacist at large; he believed many of the houses had caused their detail men to stop that kind of work.

Every time a pharmacist came in contact with a letter of the character just read, and every time such a matter was learned of there should be a strong protest; that very often physicians who were friendly to the pharmacist came to him and told him what the detail men had said to them in reference to their preparations and what detrimental remarks had been made in reference to the matter as against pharmacists connected with phases of the pharmacist's work; and that in his opinion the American Pharmaceutical Association ought to air those things in order to put up such a protest that guilty pharmaceutical houses would be compelled to stop that kind of advertising.

Chairman Freericks then inquired whether there were any other remarks on the motion to refer the address to a committee of three. Dr. Weinstein then moved that the letter read be referred to the same committee. There being no further remarks, the motion was put, and carried.

Chairman Freericks then appointed Mr. Nitardy, Mr. Osseward and Mr. Se Cheverell as members of the committee.

Chairman Freericks then yielded the chair in favor of Chairman Thiesing of the Commercial Section, in order that he might offer his report.

#### CHAIRMAN FREERICKS' ADDRESS.

We may know whether we have rendered truly worth-while service from the work undertaken and performed. Year after year new minds apply themselves to the confronting problems; they seek advancement and light; they devote thought and study in order to help the common cause and to bring real progress. If only we would devote ourselves toward accomplishing, toward crystallizing and realizing in deed, the valuable word of our predecessors, then we might submit results and prove duty at least in part performed. Systematic, co-ordinated, and well planned effort, is our need. There should be a continuity of work and thought, not to the exclusion of new thought, and the commencement of new work, but nevertheless with an aim first at results.

Last year Chairman Craig served this Section with advice of true value. If only it be my just claim that we have advanced toward realization in a small measure and heeded in part the advice so given, then my office has not entirely failed. Well might I adopt the Address of last year and leave it, for its wholesomeness I cannot hope to improve. Of course custom and needed reference to current events will not permit that I adopt the Address of last year, but most earnestly do I ask you to continue mindful of the recommendations then made. The papers and reports which will be presented at this meeting may prove at least an attempted start at realization.

#### OUR LEGISLATIVE CONCERNS.

Correct, desirable and worth while legislation can follow only in the foot steps of well directed education. Legislation predicated and dictated only by self-interest without due regard to the needs of all, is built upon sand. The proper needs of all cannot be understood, measured and consummated unless they find general intelligent attention and endorsement. As the whole people advance, and progress, so do a large portion of them learn to know better and higher things, and learn to adjust their affairs in keeping. That which satisfied and sufficed fifty and a hundred years ago, will not answer at all to-day. Our ideals are upon a loftier plane, we are less new and consequently more exacting. It is not the few who unsupported may direct the course of correct and truly needed legislation, no matter how much they may be right in proclaiming such need. It hap-

pens, of course, that necessary legislation in accord with the public welfare, results from the active effort of a few, but unless the public understanding is raised to the level of what is truly desirable, the result is of no practical value, meaning only more laws and more violation of laws.

The needs of pharmacy for better and correct legislation point in every direction. Year in and year out pharmaceutical bodies discuss these needs, to accomplish little, but to suffer more. In a large measure our efforts toward legislative improvement have been misspent. We have overlooked or ignored the unshakable fact that we cannot have a correct public understanding of legislative needs pertaining to pharmacy unless we first have a correct education of the Public mind. It is for us to reach the public. This we may do either by agreement with and between all who are its acknowledged spokesmen on a particular subject, or, if this fail, then by direct appeal. Our legislative aims and efforts are either right or wrong. If wrong they should fail, if right they must win. Right or wrong we cannot hope for determining results unless we are first willing to seek agreement with all who may be directly concerned, and then if special interest will not grant what public welfare demands we may look to the general public by an intelligent statement of our case. No other class of men and women have at hand such wonderful opportunity for successful appeal to the people as have the pharmacists of the country. Let our cause be right and it will be crowned with success if properly stated. Concerted action of pharmacists along that line, fairly directed, will within two years give them and through them to the people any legislative measure which they may desire and which ought to be on the statute books. The shameful and uncivilized practice, except in cases of emergency, of allowing physicians in settled communities to make and dispense their own medicines cannot withstand a proper educational campaign and much less the methods of the dark ages to have people use so-called patent or proprietary medicines without some knowledge of their contents and some means to learn their virtue.

There are no doubt other factors which should have our consideration in the matter of securing either State or National Legislation of a needed and desirable kind. Too often Legislative Measures are introduced on the initiative of Committees without having been discussed and considered by the entire body whom they represent. All may be agreed on principle but some may disagree on detail. Thus a division is created leading to chaos; dissension carried into Legislative Halls and principle defeated, all because of difference on frequently unimportant detail. In an attempt to sum up the important features for successful endeavor to secure desirable legislation we must have in mind that it can follow only and will always be largely dependent upon thorough agreement among ourselves as to every provision and detail before introduction; an earnest effort for mutual agreement in a conciliatory spirit with all others who may be specially concerned; against the continued opposition of special interests strongly entrenched, to a recognized rightful measure; a direct appeal to the public by a campaign of education carried on through every retail pharmacy.

#### EDUCATION AS IT CONCERNS PHARMACY.

We come now to the other branch of our Section work. Frankly, your Chairman enters this field with great hesitancy, and a full appreciation of his own limitations. A comprehensive outline of the status of pharmaceutical education, its advancement and its further needs require understanding not only of what may properly be expected in the practical operation of a retail pharmacy, but also of the best methods for fitting the student at college, so that he may correctly perform his duty, and appreciate his responsibilities. It is a field which can best be entered by one who as a teacher in the properly equipped college can combine his greater knowledge, and source of knowledge, with an insight to the correct practical operation of a retail pharmacy. As already stated, Chairman Craig last

year recommended activities which well deserve the attention of those who are concerned with them, and if they be acted upon, and are carried through to actual realization, the cause of pharmacy will have been splendidly served. A few observations from one not so well qualified concerning actual conditions as they appear to exist may not be out of place. Clearly would I want it understood, that my concern is with the retail pharmacist, and the teacher who at college prepares the student for retail pharmacy. Notwithstanding the proclaimed catholic character of our Association and its mission, my heart and mind are primarily concerned with the retail pharmacist, the apothecary if you please, his preservation and future. I contend for a place in the sun to the retail pharmacist. Our Association and this Section must be primarily concerned with retail pharmacy and its future. What good purpose can it serve, to ever increase the requirements for becoming a pharmacist in the face of ever-decreasing opportunity to exercise the functions of a retail pharmacist?

We serve no purpose in the general economic scheme by educating and training young men when at the same time we stand by and allow conditions to grow which make such training and education utterly useless and a waste of time. It does not require higher education, larger training, and greater learning to be merely a distributor or hander-along of the products manufactured by others. The very life of retail pharmacy demands that a halt be called. If the practice of retail pharmacy justifies its continued existence, as I certainly believe it does, then something must be done to stop the inroads which are being made upon it. Our colleges and schools of pharmacy depend for their student body upon the young men and women who intend to be engaged in retail pharmacy. If such institutions are to serve only for educating and training the men or women who would enter manufacturing pharmacy, then time will soon decrease their number. Notwithstanding the pre-requisite and its extension, yes in fact because of it, a revolution is bound to come unless there be a stay in the trend of proceedings; unless the opportunity for the exercise of pharmaceutical skill and learning be retained and increased for the retail pharmacist. In my humble judgment it is for the teachers in pharmacy to direct their attention toward that end. An evil condition now exists and constantly grows. It can be met and best overcome by those whose knowledge and learning peculiarly fit them to cope with such situation. Our colleges, and schools of pharmacy, must take the lead in devising ways and means for preserving and again creating the necessary opportunity for retail pharmacists. Largely it is for them to awaken greater interest among medical men, and in medical institutions for correct retail pharmacy.

Understand, that I have no desire to attack any of the magnificent industries which have grown up in pharmacy, in fact there is a sincere desire for their continued progress and prosperity. I have no motive whatever not founded on the best of good will, but in the cause of pharmacy, retail pharmacy must stand first. Well may we direct our attention to the propaganda for the use of biological products, not with a view of retarding progress and improved medication, but with a view of checking zealous prejudice often inspired by the necessities of self-interest. A distinct tendency seems evident also to crowd out and belittle vegetable therapy, when it is not at all certain that this should be allowed. Experience has taught that the hankering for something new, the following of style and fashion frequently leads to discarding what is more useful and the taking on of something less useful. Who is to grapple with such possible situation in Pharmacy unless it be men who are by learning and training fitted, and foremost among them as a class, as are our teachers in colleges and schools of pharmacy. Certain it is that this matter is of serious concern to retail pharmacy, and while a proper regard for the public welfare should always be uppermost and should always demand a thorough and impartial test of the new, it equally demands that the old which has been tried and found of service be not thrown over-board to suit fancy or self-interest.

With your kind indulgence, and in the light of what has been said herein we would now discuss briefly the events of the past year as they concern pharmacy, either in the presentation of new problems, or the saving or continuation of old ones. It is most thoroughly appreciated that views which may be expressed by me in that connection, may not be in accord with the views of those who are better fitted and better qualified, but at least I may ask that they be credited with sincerity and conviction.

#### THE FEDERAL REVENUE ANTI-NARCOTIC LAW.

The so-called Harrison Law which became operative March 1st has attracted public attention second only to the Food and Drugs Act. Simultaneously with its becoming effective the Commissioner of Internal Revenue promulgated regulations, some of which prove an appreciation of the difficulties to be overcome. That these regulations in part amounted to legislation cannot be held against the Commissioner who recognizing his inability to accomplish the proclaimed purpose of the Law, was compelled to thus provide what he should have found therein. The danger however remains, that these needed regulations, concerning particularly the distribution by physicians, dentists and veterinarians, may not stand the test of judicial decision, and accordingly any contemplated early amendment of the law should include proper provision in that respect, the need for which is largely substantiated by the Commissioner's action. Amendments are almost certain to be necessary.

Without any desire to under-estimate the right of all to find consideration and opportunity to be heard, it is to be sincerely hoped, that the representatives of retail pharmacy will have a greater voice in deciding upon the scope of such amendments. In general we must recognize on the part of the Internal Revenue Department an earnest and intelligent endeavor to make the law serve its intended purpose. It is but to be expected that the many details, each having two or more aspects, should at first result in decisions and regulations, which though intended for the public welfare may not be so. It is certain too, that some regulations have been prescribed which go beyond the provisions and intent of the law, adding to responsibility where it was not intended and causing fear of violation among those who desire to be its staunchest supporters. In some cases such regulations appear to be even in direct conflict with the expressed provisions of the law. Most important among these, and one which seems to be indefensible, is the regulation under which physicians' prescriptions, containing the minimum quantities, are held not to be refillable. This is certainly in direct conflict with the law, and in most instances will work unnecessary hardship on the general public. Our Association should declare itself in no uncertain terms of protest against that regulation.

#### PATENT AND TRADE MARK LAW REVISION.

It is not my purpose to anticipate the report of your Committee on Patents and Trade Marks. With the deep study that has been given this subject by Chairman Stewart it is not likely that one less well informed can treat the subject with hope of profit to you. Nevertheless it is my firm conviction and I believe it a duty to so say, that there has been no general effort for clearly understanding the needs of patent and trade mark law revision. There is some evidence of what in part at least may be prejudice dictated by self-interest. If American pharmacists and the public in general do not awaken to an active intelligent understanding, it is barely possible that they may have changes in the patent and trade mark laws imposed upon them, of which they had no thought at all, and which possibly may shock their sense of justice.

#### THE STEVENS PRICE MAINTENANCE BILL.

The maintenance of prices on articles of proprietary character, not involved with agreement between manufacturers, or other sources of supply, is in my

opinion a positive necessity. The Stevens Bill may be regarded a proper medium for crystallizing favorable sentiment toward such price protection. On that account it should have the hearty endorsement of every pharmacist and of this Association. The distribution of proprietary articles constitutes a large part of the business conducted in most every retail pharmacy. To be compelled to distribute them without profit is unjust, and what is more, results in conditions which surround many pharmacists and compels them to ignore true pharmacy because of the worry incident to making both ends meet.

#### STATE ANTI-NARCOTIC LEGISLATION.

Immediately after the so-called Harrison Bill became a law, and in fact in anticipation of its becoming a law, various persons or sets of persons became interested in drafting model bills for enactment in the several states, in order to make the respective state laws conform with the National Law, and in order also to make provision for some features not taken care of in the National Law which were believed to be necessary. It is not within my province to here enter upon a discussion of the merits or demerits of the several bills so resulting. It is altogether certain however that the anti-narcotic laws of nearly every state need amendment, in order to make them conform with the provisions of the National Law and to supply some needed provisions for the exercise of the police power not found therein. Undoubtedly retail pharmacists are largely interested in suitable state legislation to govern the distribution of narcotics, and it should be noted and kept in mind that the enforcement of state laws pertaining to narcotics must be largely if not altogether under the supervision of pharmacists. Any bill or law which fails so to provide should on that account alone be condemned. The subject I cannot well dismiss without expressing it to be my opinion that the Model State Anti-Narcotic Bill of the N. A. R. D. is the best and most comprehensive of its kind ever presented.

#### THE SINGLE STANDARD.

In connection with the Federal Food and Drugs Act as also in connection with state laws of that character much has been said in favor of eliminating the so-called double standard as it concerns drugs. The objection, frequently well grounded, that the double standard gives occasion for fraud and misrepresentation is a constant source of contention. In a paper read before the American Chemical Society by Dr. James H. Beal a solution for the difficulty is well pointed out. It is made plain by him, that all well grounded objections to the Federal Law and to the state laws which follow it, are based upon the prescribed methods for showing a variation from the official standard. There is absolutely nothing in the law, which would prevent the promulgation of a regulation to make impossible misrepresentation and subterfuge under the law as it now is.

#### PUBLICATION OF FORMULA.

Because of an ordinance enacted by the New York City Board of Health the question of requiring publication of formula for all proprietary medicines sprang into national prominence during the year. It may not be denied that the public or its qualified representatives should have some knowledge regarding the potent drug content of proprietary medicines, but it would seem both unnecessary and unfair to require complete publication of formula. This would mean the destruction of recognized property rights without compensating return to the general public. It seems to me that the advocacy for complete publication of formula is not grounded so much on a desire to protect the public welfare as on a possible desire to destroy the sale and use of proprietary medicines, which, notwithstanding their frequent condemnation are often serving the best interests of the public. It must be recognized however that the agitation for formula publication is growing, and that it finds many supporters among those who believe the public entitled to know

the potent drug content of such preparations, but who have no desire to destroy property rights. Our Association is in a splendid position to serve the best interests of all concerned in this very important matter, without giving aid to those who would proclaim public well being, as a guise for covering up the aims of prejudice and misdirected self-interest.

#### THE NATIONAL DRUG TRADE CONFERENCE.

The necessity and usefulness of the National Drug Trade Conference to pharmacy is urged by the best men of our Association. Personally, I have been unwilling to admit that to this time it has rendered service equal to its opportunities and which might not have been better rendered without its existence. Gladly will I agree that the Conference may become a most important factor in the correct disposition of legislative questions concerning the various branches of pharmacy, and also medicine as connected therewith.

Though denied at our Detroit Convention the right to have such views published, I beg again to say that in my judgment it is a most serious mistake and against the welfare of our Association to be as such represented in the Conference. Delegate representation therein for our Association, because of the various interests combined in this body, augments directly the number of representatives of one or more such interests, thus having a tendency to cause dissatisfaction and distrust. The Conference was called into life under the auspices of this Association and its connection therewith should properly be limited to a general supervision and a furtherance of good will, all of which may be splendidly accomplished by this Association furnishing the presiding officer for the Conference who should be without voice in its conclusions. In this connection may I also give expression to the personal opinion that an element now finds place in the Conference whose aims and interests are in direct conflict with the best interests of retail pharmacy, and which is representative of the greatest evil now confronting it. Admittedly the Conference is to provide agreement and mutual understanding among the various branches of pharmacy, a spirit of conciliation and fairness toward each other, as based upon understanding and common endeavor. It must not be out of mind however that business interests, which are so directly in conflict with each other, as are those whose continued existence depends either upon the physicians' dispensing evil, or its elimination, cannot lastingly work in common. In order to serve a just cause well it should not be placed in a position of having to entertain a compromise with evil.

#### STATE SUPERVISION OVER COLLEGES AND SCHOOLS OF PHARMACY.

Practically without state supervision many of our colleges and schools have rendered immeasurable and inadequately compensated service to pharmacy. They have not only kept pace with progress and advancement, but have been the primary cause of it. We have had an opportunity in them to observe a period of development of a voluntary nature. In late years however organized society in many states has learned to prescribe requirements which have the force of law, and a tendency on the part of other states to enact such laws seems to be growing. A higher standard and development voluntarily undertaken is based upon the highest ideals and loftiest aims for which state supervision is unnecessary. On the other hand when higher requirements are to be enforced by law they open up opportunity not before existing for only a technical observance of the law letter and a consequent circumvention of the law spirit.

The College Pre requisite may have a distinct tendency to create colleges for profit. If the state would prescribe higher requirements for all, it seems that it should also determine or at least supervise the means and instruments for meeting such higher requirements. Is it not time that the colleges and schools heretofore working against great odds in service of the ideal should undertake to secure legal safe-guards against what may be devoted to purely material ends;

against the prostitution of teaching pharmacy to serve personal gain? It may have been correct in the past to assume that the standard of colleges might well be left to those who govern them as also a decision on the qualification of their teaching staffs, but new conditions are being created. A college may be conducted to furnish and inculcate true and wide knowledge, and again it may be conducted to enable its students to qualify for meeting the limited, even though perfect requirements, of a State Board Examination. If the state is to prescribe provisions which shall govern the teaching institutions, and is to assume supervision of some sort over them, it rests with the existing institutions to advocate such provisions, and to submit themselves to such supervision.

#### A SURVEY OF PHARMACAL EDUCATIONAL METHODS.

Such survey was proposed last year by the Chairman of this Section and approved by it. The task is no small one, and involved with very many difficulties, but a start has been made through a Committee appointed for that purpose which will make its report at one of our sessions. The importance of the work, and the good which may result from it prompts me to ask for the Committee, which no doubt is to be continued, a hearty co-operation on the part of our colleges and schools.

#### THE INTERNAL REVENUE EMERGENCY LAW.

Because of concerted action on the part of all branches of the drug trade The Congress was prevailed upon last year not to impose a tax upon proprietary medicines, though it did impose such tax upon the consumer. As a matter of fact the tax does not reach the consumer at all, and to a large extent is drawn from the retail druggist, who does not share in the luxury. There is a growing opinion that the Government will need to continue an Emergency Revenue, and if this should prove true, our Association through its Legislative Committee should take steps to oppose the continuation of the tax on toilet articles, advocating if necessary, that it be placed upon articles of luxury with a view of reaching those who enjoy them.

#### LIMITATION IN THE NUMBER OF PHARMACIES.

There appears to be a growing discussion which in some manner would favor a limited number of pharmacies. Undoubtedly the growth of the chain drug store has much to do with this agitation. In a consideration of the subject we are first of all confronted with a legal situation which without fundamental change would make such restriction impossible. Advocates of such restriction seem to assume its possibility by reference to legislation which in many states governs the trafficking in liquor, but they overlook the fact that restrictions in connection therewith are founded upon changes in the basic law of such states. Aside from such restrictions specially engrafted into state constitutions, the fundamental idea continues therein, that all shall have equal, unlimited and like opportunities.

It is not however altogether impossible to limit the number of drug stores, if such upon matured consideration finally appears to be desirable. Inroads upon basic freedom of action have been made with reference to the distribution of alcoholic beverages, because a required majority of the whole people deemed this necessary. At least equal if not greater reason exists in the public mind today for restricting the distribution of narcotic drugs. Amendments to the constitutions of the several states are now in most of them comparatively easy to submit for decision. A constitutional amendment might be offered in most states, under which the right to distribute narcotics and their preparations can be restricted to one place of business for a certain number of population under license to be issued by the board of pharmacy. With proper provision for emergency distribution by physicians, there is but little doubt that such constitutional amendment would be favored by the whole people. It will be appreciated that with such fundamental

change and under a license system of that kind, it would be one of the very first conditions that the licensing board grant at least one license to every suitable applicant, before granting two or more to any one, and thus the number of licenses which may be granted would likely be exhausted by giving one to each applicant for one place of business. It may be fairly assumed, that even a so-called system of chain stores would find it difficult to adequately prosper if the permit to supply the legitimate needs for narcotics and their preparations were limited to one of its stores. The other stores would then not be drug stores. This thought is submitted for consideration in connection with the discussion referred to, and may in that respect serve a purpose.

#### A MODERN PHARMACY LAW.

Shortly after the Detroit Convention your Section Officers agreed upon a plan to interest pharmacists in all of the several states in the drafting of modern and uniform laws pertaining to pharmacy, to include the best of all of the present laws and such added features as will more properly meet present day advancement and needs. With the aid and approval of the Presidents of State Associations and State Boards of Pharmacy, a Voluntary Conference for undertaking this work was created to consist of a Representative from each State Association and State Board under the auspices of the Section on Education and Legislation. It is pleasing now to report that forty-two State Associations and forty-four State Boards of Pharmacy are represented in such Conference. A report of the work of the Conference will be made at the separate session on Wednesday morning, and sufficient time is now taken to merely refer to the intended work which has hardly gone beyond its preliminary stages. A continuance of the Voluntary Conference is most earnestly recommended because of the conviction that it is a splendid undertaking for this Section which in many respects is best suited to carry it on. The work as it progresses should find the widest possible consideration and discussion. It is recommended that there be allowed the Section for such work an annual appropriation of at least \$100.00, until completed.

In closing this address I must not fail to express my sincere appreciation for the aid given me by the other officers of the Section, and particularly grateful am I for the contribution of papers and reports which there is reason to believe will make the sessions of this Section both enjoyable and profitable.

Chairman Thiesing of the Commercial Section then stated that the body had listened to the very excellent report of the Chairman on the Section of Education and Legislation, together with its suggestions and recommendations, and asked the pleasure of the assemblage regarding its disposition.

It was then inquired of the Chair as to whether it would be necessary to refer the address to a Committee of the Section on Education and Legislation which would meet on the succeeding day, whereupon Chairman Freericks stated that the usual course was to refer it to a committee of three, and it was so moved.

Chairman Freericks then put the motion and desired to know if it was the wish of the members to discuss any of the features of the report before referring it.

Dr. J. H. Beal stated that the nature of the report made it very difficult to discuss; that it dealt with a large number of subjects in a very interesting manner and with some in a very comprehensive manner, and he desired to add, in an admirable manner.

That it was one of the most remarkable addresses that he had ever had the pleasure of listening to, and as of course many present knew, he disagreed with the Chairman on the matter of the Drug Trade Conference; nevertheless, the

Chairman had pointed out some of the means in his paper by which it might be improved.

Dr. Beal further stated that fortunately the Chairman and he seemed to agree on the particular points discussed, and he therefore took great pleasure in seconding the motion to refer the address to a committee of three.

Prof. H. P. Hynson said that he more or less agreed with the Chairman in regard to the Drug Trade Conference, not in regard to its inefficiency, but in regard to the American Pharmaceutical Association's connection therewith. Chairman Freericks had so ably pointed out that the Drug Trade Conference was closely connected and allied with the American Pharmaceutical Association, and in his opinion the presiding officer should be elected by the American Pharmaceutical Association; that he desired to state that he was heartily in accord with that, and that the thought was in accordance with the idea of collating all the national associations in the United States. That the Chairman was in exact accord with him on the question of the House of Delegates; that he desired, however, to bring up the question while he was on his feet that Chairman Freericks had said that there had been already presented in the House of Delegates a modern and model pharmacy law, and that in his opinion this furnished an excellent example of what the functions of the House of Delegates should be: a collation of the State Associations for the consideration of such topics as a model pharmacy law; that the Chairman had made a very excellent address in favor of the restriction of delegates, and he was therefore very happy and hopeful over the prospect.

Prof. Newcomb then inquired whether it was the intention of the motion to refer the request for a hundred dollars for work of the committee to the Council. Chairman Thiesing stated that he believed that that would come in the form of a recommendation to the Council. Whereupon Prof. Newcomb stated that if he was in order he would like to make a motion to that effect.

Chairman Thiesing then stated that the committee could make a report on the matter and it would be referred then to the Council. On motion, receiving a second, the question was called for and carried.

Chairman Freericks then named as the Committee, Messrs. Packard, Claus and Snow.

Prof. Remington said that he had listened to the address of Chairman Freericks and desired to express his approval, not only that, but his appreciation of the comprehensive character of the report.

Chairman Thiesing of the Commercial Section announced that the next order of business would be a paper by Dr. James H. Beal for the Section on Education and Legislation entitled, "Desirable Legislation as an Aid to Maintain Pharmacy."

Chairman Thiesing stated that the next number on the program was a paper by Mr. W. H. Cousins.

Mr. Cousins said that he did not know his paper was to contain anything about legislation, so he had prepared a paper on "The Business Needs of Pharmacy."

After discussion the paper by Dr. J. H. Beal was referred for publication, discussion of the paper by Mr. W. H. Cousins was deferred until after presentation of the papers by Dr. Wm. C. Anderson and Professor H. P. Hynson.

Chairman Thiesing then announced the next paper for the Commercial Section, "How the College May Better Equip the Student for Business," by Dr. W. C. Anderson, and the one by Professor H. P. Hynson on "Commercial Training in Colleges of Pharmacy," for the Section on Education and Legislation. After reading of the papers and discussion Dr. J. H. Beal moved that the papers read and discussed be referred to the Publication Committee, seconded by J. C. McGee.

The question was called for and carried.

Chairman Freericks on resuming the chair said that he was certain Chairman Thiesing would give his consent to the announcement of the next two papers, he also stated that the report of the Commission on Proprietary Medicines had been referred to this session for discussion by the Council.

The paper by P. Henry Uech on "Present Method on Prescription Charges. How the Joint Consideration by Physicians and Pharmacists of the Change in the Method of Prescription Pricing can Serve to Produce a Better Understanding Between Them. The Possibility for Educational Advantages," and the paper on "Present Methods of Prescription Pricing," by Dr. A. O. Zwick, were referred for publication.

Chairman Beal then presented the report of the Commission on Proprietary Medicines in abstract.

(This report will be printed in full.)

Chairman Thiesing then resumed the chair and stated that in accordance with the by-laws, nominations of officers for the Commercial Section were in order.

Mr. R. S. Lehman of the New York, was nominated for Chairman. Dr. J. H. Dawson and Mr. W. H. Cousins were nominated for Associates.

Chairman Freericks on behalf of the Section on Education and Legislation stated that nominations for officers of that section were in order.

Frank H. Freericks was nominated for Chairman and R. A. Kuever for Secretary.

On motion Chairmen Thiesing and F. H. Freericks put the motion for adjournment until the next sessions of the respective Sections. Carried.

#### CAMPHOR FROM SHRUBS.

The Bureau of Science of the Philippine government is making a study of the plant known as *Blumea balsamifera*, known by the natives in the Philippines as "sambon" or "gabuen," and which produces camphor. The shrub is one of the most common weeds in the Philippines. It grows from 5 to 8 feet high, with a stem almost woody in texture, and has long been used by the natives of the Philippines as well as by natives of China for medicinal purposes. The Chinese in parts of Kwangtung and Kwangsi Provinces already distill considerable camphor from the plant, the chief drawback to the more extensive use of it being the amount of labor required to secure the gum. It is well to note in this connection that the Bureau of Forestry at Manila is introducing the ordinary camphor tree of China and Japan into the mountain districts of Luzon in large numbers for the purpose of building up future camphor production in the islands.—*Consular Report*.

## Editorial

E. G. EBERLE, Editor.....63 Clinton Building, Columbus, Ohio

### THE PHARMACOPŒIA AS AN EDUCATIONAL PROBLEM.

**W**E hope in this or in the succeeding issue to present a paper read before the Section on Practical Pharmacy and Dispensing by Mr. Joseph Weinstein under the above title.

When the last U. S. Pharmacopœia was issued, physicians and pharmacists met in nearly all of the larger cities to discuss the changes therein, and with a sincere purpose of arriving at a better understanding of this official guide.

Soon we will have not only a new Pharmacopœia, but also a revised edition of the National Formulary, offering an excellent opportunity for stimulating co-operation between physicians and pharmacists, conducive to better pharmacy, more scientific practice of medicine and greater efficiency in service.

Those who participated in the endeavor to arrive at a better understanding of the Pharmacopœia when the last edition became effective, recognized some defects in the methods pursued at that time, which only infers that they have profited by experience.

It occurs to the writer that the weekly or monthly meetings now quite general among physicians, dentists and pharmacists may easily be adapted for the purpose of studying more closely the Pharmacopœia and National Formulary. The chairman should be assisted by associates from all three professions, each one selected because of his acquaintance with one or the other of the subjects that will be presented in connection with the study. In that way no source of related information will be overlooked.

It would be helpful at the meetings to have abstracts of the final changes in the Pharmacopœia or proof sheets; the same applies to the National Formulary. Such interest will develop the spirit of improvement in the pharmacist and cultivate the physician's acquaintance with these two books, so essential for the scientific practice of medicine and pharmacy.

Another thought brought out in the paper referred to, was further education of those pursuing pharmacy and particularly for those who have not the advantages of a college of pharmacy education.

Objections may be advanced by some, but conservative consideration will reveal that such a plan is simply a concession to modern thought, that education is not for youth alone. It is exemplified in the expanding development of school and university extension. State and Nation have undertaken to provide education, in its limited school sense, without regard to years of the applicant. Even the farmer avails himself of the opportunity, while in every other line of work, wherein knowledge and science may be helpful, instruction is being offered.

New York University in compliance with a request of the Public Health Council has provided two short courses in preventive medicine. Primarily, these are intended for public health officers, but all who are interested in public health

problems may take advantage of the opportunities offered. One course requires six weeks' attendance, the other, one week's stay in the city and the studies may be completed at home. It is realized, that most of those participating take the course for some particular needs, and accordingly the Public Health Council inquires into the experience of those attending, so that the course may be outlined for their special needs and direction given for their studies.

At present there need be no embarrassment for engaging in study at home or elsewhere, simply because of years. The invitation for further study is universal, in fact, it is becoming essential for every individual to be busy with some definite course of study or self-improvement.

The objective of continued study is usually for self-culture, but this is no reason why the education should not be sought for improving the individual's qualification in the trade or calling in which he serves the public. Examples may be cited of persons who take examinations in various lines for refreshing their technical knowledge and testing their advance in the technique of their trade. Physicians avail themselves of post-graduate courses for like reasons. Such methods can hardly be made compulsory, their acceptance must remain an individual response. If annual examinations were required of pharmacists, it might embarrass the boards, and pharmacists might experience discomfort. The value, we desire to point out, is the worth of the resolution "to keep on learning," it is this initiative, which seems to be becoming more general, in professions as well as trades—the provision of educational opportunities, without concern for the pupil's years.

The suggestion of the author of the paper was more particularly directed to schools that in some instances have taken up the work of assisting ambitious druggists, who realize and appreciate that they ought to be better informed regarding progress in the science and art of pharmacy. This need not remain the narrow precinct, local druggists' associations can readily formulate a plan for mutual and general advancement.

#### PRICE MAINTENANCE.

THE American Pharmaceutical Association is on record in favor of a uniform price maintenance measure and every effort should be made to promote the passage of a law which will accomplish this.

In order to make possible the most effective work in that direction decisions that have heretofore been rendered and the adverse arguments advanced should be carefully analyzed. We are agreed on what is desirable from our viewpoint, but it does not embrace the counter-argument or the views of the opposition, and these are really the points we should study.

The substance of previous statements made in these pages are repeated in saying that cut-prices may destroy the sale of a product, by some declining to handle an article, while others who have made this a leader, in order to attract trade, discontinue selling it after a time and exploit other preparations instead. The dealers in the small towns must reduce their prices to conform to the cut-rate stores of nearby cities, or lose the business of those informed regarding the

lower prices obtainable. There is the further possibility of creating distrust relative to the genuineness of the product. The manufacturer is liable, not only to suffer loss of trade, but have his publicity campaign become valueless. The producer is therefore as deeply concerned in the maintenance of prices as the retailer.

Thus far the courts have, to all intents and purposes, decided that the owner of the goods alone has the right to say at what price they shall be sold. If therefore a complete transfer is made from the manufacturer to the retailer then the right to fix the selling price is also conveyed. In order that the manufacturer may still control the selling price, he must either consign the goods or at least retain a vendor's lien of some kind thereon, and effective until the package passes to the consumer. The terms, under which the goods are shipped to the retailer, would have to be legal; if unsold, the manufacturer would be compelled to take back the goods at the price which the retailer would have paid him, if sold. Very likely the law would demand that each and every package be marked, so that the consumer-purchaser has a knowledge of the terms under which the same came into the possession of the retailer.

This proposition would hardly meet the approval of the small manufacturer, because in order to sell in profitable quantities under such conditions, would necessitate large financial resources. It also further indicates a possibility that strong financial concerns might be perfectly willing to adopt selling methods that contribute advantages to them and are disadvantageous to their less fortunate competitors. The result might finally be that the profit fixed by the former would be inadequate for a small retail business and productive of greater dissatisfaction than are the present methods. It is only reasonable to expect consideration from Congress of the right of the purchaser to patronize the cheapest market as well as his privilege to dispose of his purchases at any price he may desire or be compelled to.

These suggestions and deductions are only presented so that offensive and defensive preparation may be perfected in the interest of a price protective measure before Congress convenes.

The following thoughts are offered: A patentee must protect his rights in the courts, which naturally implies that he has bought some kind of protection from the government. When a manufacturer copyrights a name, he also is protected against unlawful use of the copyrighted name by others. Why, if in the first place the name of an article is copyrighted, could not the government grant additional protection of the sale-price on the same? Under the proviso that if the retailer is not willing to sell at the specified price, he will have the right and privilege of returning the goods to the manufacturer or jobber from whom obtained and receive the fixed wholesale price.

Such protection might be bought for a designated sum paid to the government or, as additional revenue is necessary, price protective stamps might be affixed to the goods. Then the government would be giving something in return for taxation, a benefit which manufacturers would be willing to pay for. The government insures against loss by mail and this is not altogether foreign to the idea suggested.

## NEW TAXES.

ONE subject that is quite certain to engage the attention of Congress at its next session is additional taxation. The so-called war taxes of a year ago have not made up the deficiency occasioned by the decreased receipts. Imports are not materially increasing and sugar will soon go on the free list, suggesting further decrease of such revenue from import.

A large Army and Navy necessarily will involve extensive appropriations and these are apt to become permanent. By proper economy, expenditures in other directions might be materially reduced and, comments the *Saturday Evening Post*, "Also no doubt whiskers might be grown on a pumpkin." We have long ago become reconciled to the fact that it is very much easier to establish offices and precedents for expenditures than to retrench. This is not only true with the government but in business and with other organizations.

Where will the additional revenue come from? The question is one that requires the most serious consideration and the solution should be arrived at by establishing a system that will more specifically provide for the future. The present deficit will easily be dealt with, one way or another, even though it may mean unjust taxation for some.

The immediate needs will possibly be derived in part from further stamp tax and some members of Congress still look to the lost opportunity of such taxation on proprietary medicines. Every effort should be made to prevent such attempt, for this means additional taxation of the retail druggist. The tax on telegrams, for example, is not paid by the Company for they charge the price of the stamp in addition to the message; the buying public will not pay for the extra stamp tax on merchandise and it is impractical to make the charge.

There should be an export tax on war material; the income tax should be imposed on a far greater number than under present exemptions. One cent letter postage should by all means be discouraged, in fact, an increased rate might be the easiest method for the production of revenue and every one would be contributor.

Finally however the provisions for revenue should come from a source that will not only produce revenue continuously but at the same time encourage American manufacturers. We do not desire to make a political application, but our tariff system has frequently been prompted by local conditions and the political strength which supported them. When the war is over we will have to adjust ourselves to the conditions which will develop after peace in Europe has been declared. We do not care to foist personal opinion on our readers as to what they will be. Each one has his or her views and so also on the tariff question. This much however we can all be agreed upon, that if the question was studied by unprejudiced minds, by men who are qualified morally, intellectually and by experience, they could formulate a scientific method for making tariffs.

A movement is under way to have Congress provide for a non-political tariff commission. It remains to be seen whether public sentiment can be aroused to sterilize the tariff as a political issue and insist on making provisions for a permanent tariff policy for the United States, worked out by specialists and experts.

We simply submit this important subject for consideration because in our belief, industries allied and closely related to pharmacy may be benefited and so that as citizens our readers may participate, after carefully and thoughtfully studying the possibilities. Business men are beginning to take deeper interest in matters that shape and regulate their activities and whenever the public positively determines that a thing shall be done, Congress and legislatures yield.

Papers Presented at the Sixty-Third Annual Convention

### THE ASSAY OF BALSAM OF PERU.\*

FRANCIS D. DODGE AND ALFRED E. SHERNDAL.

"Balsam of Peru" is the name applied to the resinous exudation obtained from the tropical tree, *Myroxylon Percirac*, occurring in Central America, principally in the republic of San Salvador.

The balsam comes into commerce from the port of San Salvador; is of some medicinal importance, and also finds a limited application in perfumery.

As regards its chemical composition, the early investigations of Delafontaine,<sup>1</sup> Frémy,<sup>2</sup> and Kraut,<sup>3</sup> showed the presence of neutral aromatic esters (benzyl benzoate and cinnamate), amounting to over fifty percent. The acid resin, according to Kachler,<sup>4</sup> yielded about sixty percent of protocatechuic acid.

A more thorough examination of the balsam was made by Thoms,<sup>5</sup> who found the cinnamein (or neutral esters) to consist principally of benzyl benzoate and cinnamate, with possibly some hydrocinnamic ester.

He also isolated a new alcohol, peruvicol, to which he assigned the formula,  $C_{15}H_{22}O$ . This compound, a light liquid with characteristic odor, was later found by Schimmel & Co.,<sup>6</sup> to be identical with nerolidol,  $C_{15}H_{26}O$ , the sesquiterpene alcohol isolated by Hesse and Zeitschel<sup>7</sup> from the high-boiling fractions of oil of orange flowers.

For the assay of the balsam, a rather large number of tests have been proposed, and are embodied in the various pharmacopœias and similar works. Those depending on color reactions are in general unreliable and of limited value. Dieterich<sup>8</sup> lays much stress on the acid value, saponification value, Cinnamein content, and saponification value of the latter; and the determination of these analytical constants is almost universally required by the best authorities. Yet it is obvious that such values are far from being absolutely characteristic: that they are insufficient to demonstrate the purity or authenticity of a sample is a fact unpleasantly brought to our attention by the appearance in recent years of imitation or "synthetic" balsams almost indistinguishable from the natural product.

<sup>8</sup> Analyse de Harze.

Evers<sup>9</sup> patented a mixture of styrax, esters, and gum resins, which was asserted to be fully identical with the natural balsam; and similar products, bearing the names "Perugen" and "Perugran" have become articles of commerce.

The Perfumery and Essential Oil Record, in a note on this subject,<sup>10</sup> remarks: "Samples submitted to us from M. Schultz & Co., Hamburg, are remarkable imitations of natural balsams, and in chemical and physical characters are almost indistinguishable from the genuine products." And as far as the pharmacopœial standards and usual tests go, we can only confirm this statement, as following analyses show.

No. 1 is an artificial product recently examined; No. 2 is an average sample of some thirteen lots, of direct importation, and, as far as we can ascertain, of undoubted authenticity.

	Sp. Gr. at 25°	Acid Value	Percent Cinnamein	Sap. Value of Cinnamein
No. 1 .....	1.1542	59.68	62.3	254.9
No. 2 .....	1.1535	65.20	54.1	235.9

Jensen<sup>11</sup> also gives figures showing close approximation in these constants.

Such "synthetic" products naturally become objects of suspicion as possible adulterants of the genuine and more expensive balsam, and their detection in mixtures becomes of some importance.

For this purpose the determination of the iodine value of the cinnamein, or neutral portion of the balsam, has been proposed. Jensen (l. c.) in examining three samples, one of which was imitation, found the iodine value of the natural cinnamein, 25.5; of the imitation, 1.5.

We found on Sample 1 (above) I. V. 3.6; on Sample 2, I. V. 21.0. Dieterich,<sup>12</sup> however, reported the analyses of various samples, in which the I. V. of the imitation cinnamein was found as high as 27.5. If these results are correct, it is evidently unsafe to put much reliance on this test, for the possibility is not excluded that substances may be added to the imitation product to increase its iodine value.

Benzyl benzoate shows no absorption of iodine: we found that pure benzyl cinnamate, obtained by freezing the natural cinnamein, gave an I. V. of about 7.0. Jensen (l. c.), on fractioning natural cinnamein in vacuo, found that the first 10% of the distillate had the I. V. 116, and we obtained a similar value for the crude peruvial, described below.

Optical activity is also characteristic of the natural cinnamein, and is due to the peruvial, which Thoms found to have  $a_D = +13^\circ$ . The determination of the rotation of the crude cinnamein is, however, impracticable.

Peruvial, with its high iodine value, and dextro-rotation, appears to be the most characteristic constituent of the balsam, and after some experiment, the following simple method of isolating it was devised.

*Peruvial Test.*—Twenty gms. of balsam are saponified by heating one hour on the water-bath, with frequent shaking, in a liter flask, with 20 gms. of 25% potassium hydroxide. Steam is then passed through the mixture, and the dis-

<sup>9</sup> Pharm. Ztg. 49, 524.

<sup>10</sup> March, 1914, 86.

<sup>11</sup> Pharm. J., 1913, 210.

<sup>12</sup> Perf. and Ess. Oil Rec., 1914, 89.

tillate collected in 100 or 150 cc. flasks with narrow, graduated necks. From natural balsams, we obtained in this way, in 300 cc. total distillate, from 0.7 to 0.9 cc. of light oil. Imitation balsam gave only traces of heavy oil.

The crude peruvial from 100 gms. balsam amounted to 4.5 cc. and showed the Sp. Gr. 0.917 at 25°,  $n_D^{25}$  1.40. Thoms found for a purer product, Sp. Gr. 0.886 at 17.5°,  $n_D^{17.5}$  1.37. Our preparation contained evidently some benzyl alcohol, and, in fact, by saturating the aqueous distillate with salt, 8 cc. of oil were obtained, with Sp. Gr. 1.038 at 25°, inactive, and almost completely soluble in 40 volumes of water.

Natural cinnamein contains, then, about 4% of peruvial, and benzyl alcohol is practically the only other alcoholic constituent. From 100 gms. of imitation balsam, only benzyl alcohol (Sp. Gr. 1.042 at 25°, inactive) was obtained. For identification, the peruvial from 20 gms. of balsam is sufficient. It is a colorless oil, of characteristic odor, soluble in 70% alcohol, and showing an iodine value of about 116.

If 20 gms. of balsam are distilled in the manner described, without saponification, less than 0.1 cc. of light oil is obtained, with a small quantity of heavy oil (benzyl benzoate). This indicates that the peruvial is present mostly as ester in the balsam.

The following are typical analyses from our records:

	No. 30	No. 115	No. 192	No. 776
Sp. Gr. at 25°.....	1.1162	1.507	1.151	1.154
Acid Value.....	67.3	71.0	72.8	67.6
Cinnamein.....	58.3%	51.6%	51.6	51.7
Sap. Val. of do.....	230.5	235.1	212.1	236.3
Peruvial (ex 20 gms.).....	0.9 cc.	0.9 cc.	0.65 cc.	0.85 cc.

The peruvial determination appears to be a very reliable indication of the quality of a balsam. Adulteration with fatty oil or rosin, would lower the yield of peruvial; if copaiba were present, the peruvial would be contaminated with the oil of copaiba, and would show a diminished solubility in alcohol, and a lower, or possibly a levo-rotation.

#### ACID CONSTITUENTS OF PERU BALSAM.

Thoms (1, c.) found benzoic and cinnamic acids present in the ratio of about 3 to 2, using for the determination of the latter the oxidation method of Liebermann, which is based on the reaction:

We found the acids in about the same proportion in the balsam, but in the imitation practically only benzoic acid.

The analyses were made in the following manner. Samples of natural and imitation cinnamein were saponified, the solutions evaporated to dryness, dissolved in water, extracted with ether, acidified, and the liberated acids separated and dried. Weighed amounts of acid were then dissolved in N/2 alkali, and the solutions diluted to contain 1 gm. in 100 cc. For each titration, 5 cc. were run into 25 cc. of N/2 permanganate; after standing one-half hour, the excess of permanganate was titrated in the usual manner with standard oxalic acid. For comparison, samples of benzoic and cinnamic acids were also titrated. According

to the above equation, one gm. cinnamic acid should require 135.1 cc. N/2 permanganate.

## ASSAYS.

	(Time)	(cc. $\text{KMnO}_4$ per gm.)	(Percent Cinnamic Acid)
(1) Benzoic acid .....	$\frac{1}{2}$ hr.	6.0	4.4
(2) do .....	do	8.0	5.8
(3) Cinnamic acid .....	do	141.8	104.9
(4) do .....	do (warm)	157.8	116.8
(5) Ex balsam .....	$\frac{1}{2}$ hr.	57.0	42.1
(6) Ex imitation .....	do	6.0	4.4

These results were far from satisfactory; apparently the oxidation of cinnamic acid was not quite so simple as the equation indicated. In fact, when an acid permanganate solution was used, even more erratic values were obtained, e. g. (with permanganate containing 2%  $\text{H}_2\text{SO}_4$ ).

(7) Cinnamic acid.....	5 min.	248.9 cc. $\text{KMnO}_4$ per gm.
(8) do .....	20 min.	263.1 do
(9) Ex balsam.....	5 min.	119.4 do
(10) Ex imitation.....	5 min.	19.8 do

It was evident that to secure any useful values, a more careful modus operandi was necessary: it was soon found that better results were obtained when the oxidizing solution was gradually added.

(11) Cinn. acid.....	1 gm. required	142.3 cc.
(12) do .....	0.1 gm. do	13.8 cc. (138.0 cc. per gm.)
(13) do .....	0.1 gm. do	13.7 cc. (137.0 cc. per gm.) ( $\text{MgO}$ )

With permanganate always in excess, the results were not uniform.

(14) Cinn. acid .05 gm. req.	7.95 cc.	(25 cc. used)	(159 cc. per gm.)
(15) do .1 gm. req.	14.6 cc.	do	(146 cc. per gm.)
(16) do .1 gm. req.	14.4 cc.	do ( $\text{MgO}$ )	(144 cc. per gm.)
(17) do .1 gm. req.	14.9 cc.	do ( $\text{MgO}$ )	(149 cc. per gm.)

In Nos. 13, 16, and 17, the solution contained  $\text{MgSO}_4$  in the proportion:  $2\text{KMnO}_4 + \text{MgSO}_4$ , to ensure constant neutrality.

With acid permanganate, the following values were found:

(18) Cinn. acid .1 gm. req.	24 cc.	( $\text{KMnO}_4$ added slowly)	(240 cc. per gm.)
(19) do .05 gm. req.	13.9 cc.	(25 cc. used)	(278 cc. per gm.)
(20) do .10 gm. req.	29.5 cc.	(45 cc. used)	(295 cc. per gm.)
(21) do .10 gm. req.	28.7 cc.	(50 cc. used)	(287 cc. per gm.)
(22) do .10 gm. req.	27.0 cc.	(75 cc. used)	(270 cc. per gm.)

In Nos. 21 and 22, the mixtures were allowed to stand one hour before titrating back. The oxidizing solution contained sulphuric acid in the proportion:  $2\text{KMnO}_4 + 3\text{H}_2\text{SO}_4$ .

These results in acid solution were unexpected. Benzoic acid is supposed to be unaffected by the reagent under these conditions, and the slight reduction of permanganate which we observed must be due to impurities. For example:

(23) Benzoic acid .10 gm. req.	0.5 cc.	(10 cc. used)	(5 cc. per gm.)
(24) do .10 gm. req.	1.0 cc.	(25 cc. used)	(10 cc. per gm.)
(25) do .10 gm. req.	1.2 cc.	(5 cc. acid $\text{KMnO}_4$ )	(12 cc. per gm.)
(26) do .10 gm. req.	0.7 cc.	(25 cc. used)	(7 cc. per gm.)
(27) do .10 gm. req.	0.7 cc.	(25 cc. acid $\text{KMnO}_4$ )	(7 cc. per gm.)

A solution of sodium benzoate was purified by heating several days with excess of permanganate; the latter was then reduced with a little bisulphite, and the solution diluted to contain one percent of acid.

(28) 10 cc. of this solution required 0.45 cc. (25 cc. used) (4.5 cc. per gm.).

A sample of acid prepared from the recrystallized calcium salt gave no better result, and the cause of this slight action on the permanganate remains unexplained.

In the case of cinnamic acid, it is remarkable that the values in acid solution are about twice the theoretical, approaching a limit even with a large excess of reagent (No. 21 and 22). It is not incredible that benzoic acid in the "nascent" condition may be more readily oxidized in acid solution, and a portion completely burnt to carbonic anhydride and water. But, if so, one would hardly expect any constancy in the amount of oxidizer used.

It appeared of interest to determine the actual amount of benzoic acid produced by oxidation in neutral and acid solutions, respectively.

(29) 10 cc. of a solution of sodium cinnamate containing one percent of the acid were run slowly into 25 cc. N/2 permanganate. After one hour, the excess of reagent was reduced by oxalic acid, and then the titration continued as usual with oxalic and sulphuric acids. Required: 14.3 cc. (143 cc. per gm.). The solution was then extracted with ether, and the ether solution evaporated to constant weight. The white crystalline acid weighed 0.076 gm. (calc. 0.082 gm.), and on titration required 6.2 cc. N/10 alkali, equivalent to 0.0756 gm. benzoic acid.

(30) 10 cc. of the cinnamic solution previously used were run into a mixture of 50 cc. permanganate and 15 cc. normal sulphuric acid. After one hour, titration as before. Required, 27.3 cc. (273 cc. per gm.). The acid taken out by ether, weighed 0.052 gm. and on titration, required 4.22 cc. N/10 alkali, equivalent to 0.0515 gm. benzoic acid.

In this last experiment, there is a deficiency in the yield of benzoic acid amounting to 0.030 gm. Assuming this to have been completely oxidized, according to the equation:

for 0.03 gm., 0.233 gm., or 14.7 cc. N/2 permanganate would be required, which is about the difference observed in the neutral and acid titrations on 0.10 gm. cinnamic acid. Hence it appears that on oxidation by permanganate, in acid solution, under the conditions described, about 36% of the cinnamic acid is completely oxidized to carbonic anhydride and water.

For the examination of the mixed acids from the balsam, however, the procedure of No. 11-13 will give useful results. The presence of cinnamic acid is not, of course, conclusive evidence of the purity of the balsam, for the addition of a cinnamic ester from some other source is not inconceivable. For the simple detection of the acid, the solution obtained in the usual course of analysis, by saponifying and titrating 1.5 gms. of cinnamcin is evaporated to remove alcohol, made up to 25 cc. and filtered. The filtrate (containing about 1% cinnamic acid) should give a heavy precipitate with 2 cc. of a strong solution of manganese sulphate.

## A SAFETY CHECK VALVE FOR LABORATORY VACUUM PUMP.\*

R. C. HOLMES, PHAR. D.

Laboratory workers, having occasion to use the Chapman, Richard or Sprengel forms of vacuum pump, have, no doubt, experienced difficulty in preventing the water from regurgitating into the vacuum chamber. The vacuum pumps, generally, are provided with a disc check valve, and, while new, this serves the purpose fairly well, but after some use the valve becomes congested with dirt and trouble ensues. The common remedy is to interpose a flask or bottle between the pump and principal chamber, thereby collecting the water which can readily be removed.

Under conditions of a varying water pressure the chamber for collecting water is insufficient and leads to exasperating results. Therefore, under pressure of necessity, the device here presented was constructed and used with very gratifying results.

A bottle, capacity one quart or more, is fitted with a three-hole rubber stopper and glass tubing, bent and inserted as seen in the diagram. On the end of the tubes leading to the vacuum pump, inside of the bottle, is fitted the check valve which can easily be constructed in a few minutes.

Cut a piece of glass tubing, from one-half to three-quarter inches in diameter and about four inches in length. Cut a cylindrical rubber stopper to fit inside of the glass tube; bisect it transversely, first boring a longitudinal hole. Any convenient filtering medium may be placed between these two stoppers, such as cotton or asbestos, before adjusting them in the tube about one inch from the top. Fit a one-hole stopper in the end of tube near the filter so that it may be connected with the tube to pump. Lastly, obtain a steel ball which will slip easily into the glass tube and fit a one-hole rubber stopper into the end of the tube. The inner end of the stopper must be so constructed as to

form a tight seat to hold the ball. This may be readily accomplished by heating the ball on a wire gauze over a Bunsen flame and pressing the end of the stopper over the hot steel ball so that it is imbedded about half in the rubber.

It will be found that this valve will immediately check the influx of water to the bottle when the water pressure is released, at the same time maintaining absolutely the vacuum pressure in the system.

It is best to entirely remove the disc valve of the pump proper so that there will be an unobstructed opening for the air exhaust. In the event that the water is reasonably free from dirt the filter may be omitted.

## STANDARDS FOR ABSORBENT COTTON AND ABSORBENT GAUZE.\*

---

DR. FRED B. KILMER.

---

The Author contends that U. S. P. test for absorbent quality of cotton is inadequate—glycerin and soap will increase the apparent absorbency. He suggests tests to be adopted for cotton in the forthcoming Pharmacopœia and also gives tests to which plain absorbent gauze should be subjected. Specification for cotton used in manufacturing are given.—Ed.

The large use of absorbent cotton and absorbent gauze for surgical dressings and in the arts has, from time to time, brought up the question of their standardization.

In the present day practice of surgery, generally only plain sterile gauze or cotton is required; that is to say, cotton or gauze not impregnated with an anti-septic.

In a paper published in the "Journal of the Society of Chemical Industry," October 31, 1904, the writer discussed the problems involved in the preparation of absorbent cotton and gauze for surgical purposes, and called attention to the fact that for the most part the Pharmacopœial standards are open to criticism.

The standard for absorbent cotton in the United States Pharmacopœia, Eighth Revision, seems to be inadequate as to its test for absorbency.

Absorbent cotton even when heavily charged with impurities, when pressed in the hand and placed on the surface of water, will sink. The Pharmacopœia failed to prescribe anything definite as to the amount of water to be used. This authority also prescribed that when purified cotton, previously pressed in the hand, is placed on the surface of cold water it will absorb the water and sink, and the water shall not acquire an acid or alkaline reaction.

The test of sinking in water is a test neither of purity nor absorbing power. Soap or glycerin will increase the apparent absorbency.

The British Pharmacopœia of 1914, has the following as a standard for what, in this country is termed "absorbent cotton,"

GOSSYPIMUM—COTTON (SYNONYM—COTTON WOOL.

Cotton consists of the hairs of the seed of *Gossypium herbaceum*, Linn., and of other cultivated species of *Gossypium*, freed from fatty matter.

Characters and Test. In long, white, soft filaments, each consisting of an elongated cell, appearing, when seen under the microscope, as a flattened, twisted band with slightly thickened rounded edges. Inodorious and tasteless. Soluble in ammoniacal solution of copper oxide. Readily wetted by water, and not imparting to it either an alkaline or an acid reaction. Ash not more than 0.5 percent.

This standard would seem to be loose and lacking in definiteness, and in the writer's experience several low grades of absorbent cotton can be made to meet these requirements.

A considerable quantity of purified cotton, otherwise known as absorbent cotton, is now used in the arts and especially in the manufacture of explosives. In some

---

\* Read before Scientific Section, San Francisco.

instances the Ordnance Department prescribed standards, three of which are here noted.

#### COTTON FOR SMOKELESS POWDER—U. S. NAVY DEPARTMENT SPECIFICATIONS.

Unspun cotton, prepared for nitrating purposes by bleaching cotton wastes and thoroughly washing to remove bleaching materials and lime salts; to contain not more than 7 percent moisture, not more than 0.4 percent materials which can be extracted by ethyl ether, and not more than 0.8 percent ash; to contain only traces of lime salts from the bleach and no hypochlorites; to be free from foreign matter of any kind and to be of such texture as will easily nitrate by the usual methods.

#### COTTON FOR NITRATION—SPECIFICATIONS FRENCH ORDNANCE DEPARTMENT.

Cotton to be furnished must be new, properly scoured and white. It must be free from any mixture with wastes, whatever they may be, coming from spinning mills, or factories working cotton for spinning mills. Heating chlorine bath, used for purpose of whitening, is absolutely forbidden. Any addition of coloring material, particularly blue, on purpose of modifying appearance of goods, is forbidden.

Moisture obtained by heating at 100 deg. C. up to constant weight, must never be over 6% of weight of dry cotton. However, when moisture even over 6%, is not more than 10%, delivery may be accepted, subject to rebate as shown per article nineteenth hereinafter.

Ash, fats (average) insoluble products in diluted sulphuric acid, and other material than cotton fibres, obtained as said in note herewith, must be respectively less than—0.30%, 0.30%, 0.75% and 1-5000. Cotton must be absolutely free from active chlorine. Rate of combined chlorine (Cl) must never be over 3+10000 of weight of dry cotton.

#### SPECIFICATIONS TO GOVERN THE SUPPLY OF COTTON FOR THE MANUFACTURE OF GUNCOTTON—ROYAL ORDNANCE FACTORIES, ROYAL ARSENAL, WOOLWICH.

To be bleached cotton cellulose, specially suitable for the manufacture of Guncotton.

To consist largely of fibres of long staple, preferably twisted, and to contain as little as possible of felted unspun, short fibre cotton, or dust, technically known as "fly."

The cotton must not show more than the following figures calculated as percentage on the dry material:

Moisture .....	7.0 per cent
Oily matter .....	0.6 " "
Soluble on boiling one hour in 3 percent Caustic Soda.....	5.0 " "
Reduction of Fehlings' solution (11 Vol. to 2 Vols. of water on heating 15 minutes at 100 degrees C. (Cu <sub>2</sub> O).....	1.0 " "
Mineral matter .....	0.5 " "

Except as regards the above figures, it must be entirely free from organic matter other than pure resistant normal cellulose, and on dyeing with a basic dye such as Fuchsin (Rosaniline Acetate), the fixation of color must be slight and uniform, and must show no deeply dyed particles of fibres.

Following a long series of experiments in the laboratory with which the writer is connected, the following was worked out as a rational standard for purified or absorbent cotton. It was found that this standard is one to which the brands of the leading reputable makers in this country would be found to comply. In other words, this standard is attainable, and would exclude cottons of a low grade or to which foreign substances had been added.

## GOSSYPIUM PURIFICATUM—PURIFIED COTTON—SUGGESTED STANDARD.

The hairs of the seed of *Gossypium* (Fam. Malvaceæ) freed from adhering impurities and deprived of fatty matter.

White, soft, fine filaments, appearing under the microscope as hollow, flattened and twisted bands, spirally striate, and slightly thickened at the edges; inodorous and tasteless; insoluble in ordinary solvents, but soluble in an ammoniacal solution of cupric oxide.

When Purified Cotton, previously compressed in the hand, is thrown on the surface of cold water, it should readily absorb the latter and sink.

Purified Cotton should contain no more than a very small quantity, if any, of visible impurities, and on combustion of five grams or more should not leave more than 0.2 percent of ash.

Ten gms. of Purified Cotton are saturated with 100 cc. neutral distilled water, the water pressed out and divided into two portions, each of which is placed in a white porcelain dish. To one portion is added 3 drops phenolphthalein T. S., and to the other portion 1 drop methyl orange T. S. Neither portion should develop a pink color (absence of acid or alkali).

If 20 gms. be extracted in a narrow percolator with ether until 300 cc. percolate is secured, the percolate should, on evaporation to dryness in a tared beaker, leave a residue of not more than 0.5 percent of the weight of cotton used (limit of fatty matter). A blank test should be made with an equal quantity of the ether used.

If 20 gms. be extracted in a narrow percolator with alcohol until 200 cc. percolate is secured, the percolate should not be of a blue or green tint (absence of dyes), and on evaporation to dryness in a tared beaker the residue should amount to not more than 0.5 percent of the cotton used (limit of resins and soap). A blank test should be made with an equal quantity of the alcohol used.

If 20 gms. be extracted in a narrow percolator with hot distilled water (80 degrees to 90 degrees C.) until 200 cc. percolate is secured, the percolate should not be clouded (absence of soap), and on evaporation to dryness in a tared beaker the residue should amount to not more than 0.2 percent of the weight of cotton used (limit of soluble salts). A blank test should be made with an equal quantity of the water used.

## SURGICAL GAUZE.

Gauze cloth, otherwise known as surgical gauze, has a large use not only in surgery but in the arts and even in the household.

In modern surgery a piece of sterile gauze is sometimes the only dressing employed. The process of its manufacture is well known and is given in some detail in the articles heretofore cited.

Gauze cloth in the cotton trade is known as "Cheese Cloth," "Tobacco Cloth" or unbleached gauze, and is quite distinct from surgical gauze, although large quantities of the former are used for surgical purposes. In this country gauze is spun and woven solely for surgical uses by one or more makers.

In the surgical gauze found in the market there is a variation in the length of the fibre, the size and weight of the thread from which the gauze is woven, also a variation in the yardage per pound and in other physical and chemical characteristics.

In some samples of gauze in the market there will be found certain dressings or loadings added to improve the appearance, to increase the weight, as well as to assist in holding the gauze out to its full width and length.

In the cotton trade woven fabrics of the character of gauze are standardized by taking a square inch and counting the number of threads. For example, a high grade gauze carrying forty longitudinal and forty four cross threads per square inch, carries eighty-four inches of thread.

Fabrics of this character are made in something like twenty grades beginning with gauze carrying twenty threads by ten, or thirty threads per square inch.

Much of the surgical gauze in the market will be found not to be fully thirty-six inches in width. This is accounted for by the fact that these goods are woven in the gray thirty-six inches wide, and it is not practicable to bleach the goods, render them absorbent, and retain their full width. The usual variation is about one inch per yard; in other words, the average width will be found to be about thirty-five inches.

The following table shows the threads per inch, the average yardage per pound of the best known grades of surgical gauze:

SURGICAL GAUZE.	
Threads per Inch.	Yards per Pound.
44 x 40	9.38
32 x 36	14.81
28 x 24	16.00
24 x 20	18.83
20 x 14	23.20

The Bureau of Municipal Research of New York City has made an attempt to secure uniformity in the supplies for the various departments of the City of New York. They have adopted a standard requirement for surgical gauze as follows:

The gauze shall count in the finished state not less than the total number of threads per square inch specified, shall not exceed the yardage per pound specified, and it shall be acceptable by the Bureau as first quality in every respect. Gauze delivered under these specifications shall be made from clean, white, long cotton fibre, fully bleached and absorbent, of soft finish, and upon extraction with acidulated water (2 percent Hydrochloric Acid) it shall show a loss of not more than 1 percent, and shall show no reaction for starch, soap, dextrin, glue or other filling.

The object of the foregoing test—extraction with acidulated water—is to prevent the addition of starch, soap, dextrin, or glue for making weight, increasing the apparent size of thread, etc.

The following test for Surgical Gauze was worked out in conjunction with the Medical Supply Department of the U. S. Army.

#### PLAIN ABSORBENT GAUZE.

The gauze must be free from loading material and visible particles other than cotton, and be colorless.

Two yards boiled in 500 cc. of distilled water for one-half hour, boiling distilled water being added at intervals, to replace that lost by evaporation, the water pressed out, rinsed with sufficient boiling distilled water to measure 505 cc. cooled to 25° C., and made up to 500 cc. with distilled water at 25° C., shall yield a turbidity not more than that produced by 0.030 gram of infusorial earth (passed through a 200-mesh sieve) well shaken in 500 cc. of distilled water in a colorless glass bottle, when examined by transmitted light.

Two yards boiled in 500 cc. neutral distilled water for one-half hour, boiling distilled water being added at intervals to replace that lost by evaporation, the water pressed out, cooled to 25° C., and divided into two equal parts; one part

shall be neutral to three drops of phenolphthalein test solution, the other to one drop of methyl orange test solution.

Two yards boiled in 500 cc. distilled water for one-half hour, boiling distilled water being added at intervals to keep the volume at the original quantity, the water pressed out and rinsing twice with 250 cc. portions of boiling distilled water, the water pressed out and the total volume evaporated to dryness in a platinum dish and kept at 100° C. until constant in weight, shall yield not more than 0.13% by weight of residue, of which not more than 0.045% shall be inorganic.

One yard extracted with 95 per cent ethyl alcohol in a Soxhlet extractor for five hours shall yield a solid extract, when dried at 100° C. of not more than 0.55% by weight.

One yard extracted with ethyl ether in a Soxhlet extractor for five hours shall yield a solid extract when dried at 100° C. of not more than 0.55% by weight.

One yard incinerated in a platinum crucible shall yield not more than 0.55% by weight of ash, containing potassium, sodium, magnesium, calcium, iron and aluminum, which were originally in combination with hydrochloric, sulphuric and phosphoric acids.

One yard folded into a square, the surface of which measures sixteen square inches, with the loose ends loosely joined by No. 30 white cotton thread, when held nearly in contact with the surface of distilled water and dropped thereon, at 25° C. temperature shall be completely submerged in five seconds.

LABORATORIES OF JOHNSON & JOHNSON, New Brunswick, N. J.

## Papers Read Before the Sixty-Third Annual Convention

### QUIZZES, TESTS AND EXAMINATIONS.\*

H. V. ARNY.

From the early college days of the writer, he has heard arguments against final examinations as an essential part of the college course. He has heard that passing an examination is no criterion of the ability of the student; that a bright lad can "cram" up enough information during the few weeks prior to the examination to pass that ordeal with flying colors: while a conscientious student who knows infinitely more than the "crammer," may become "rattled" and do poorly under the same test. There have come to him statements that the examination questions are made up of a lot of disjointed facts, many of which are of no importance to the candidate in after-life; that far better would it be to watch the student day by day and graduate him on his record rather than on the marking of his answers to a batch of several hundred questions fired at him on a hot day in May or June.

These arguments appealed to the writer in his less mature years, but the more he has studied the question the more he sees how shallow is the logic of those who would abolish examinations.

In fact, the movement is a symptom of that dangerous fallacy prevailing in this, "the childrens' age," as it is fondly dubbed by its advocates. The precious little ones must be permitted to follow individual tendencies unhampered by adult meddling. In order that the child develop into a free agent, a thinker who thinks for himself, he must not be hedged in by rules that were pronounced essential by our grandparents and by the Holy Writ.

This pernicious doctrine pervades our entire educational system, grammar school, high school and college, so that now the mighty word "duty" seems eclipsed by the softer one "inclination" and the onlooker wonders where it will end. In these very days we have before us the illustration of the fruition of untrammelled individualistic childhood in a rich young man who has spent seven years and a big slice of a huge fortune in getting out of an asylum for the criminal insane. But to quit moralizing and to turn to our mutton, the final examination is the greatest incentive to work that is found in the college course and can be abandoned only if similar examinations are held throughout the year.

We will discuss later the relative value of tests and final examinations and at this place will consider the need of the written examination itself.

As to the claim that the passage of an examination is merely a feat in the art of "cramming," we will inquire whether those advocating the abolition of exami-

---

\* Read before Section on Education and Legislation, A. Ph. A., San Francisco Meeting.

nations discountenance all memorizing on the part of the pupil? To cite what was said by the writer on another occasion:

"There are a tremendous number of facts that should be learned by students, despite statements to the contrary on the part of those of our teachers who promulgate the doctrine that learning should be a plethora of observation and a paucity of memory work, and I venture to go so far as to say that the reason some of the exponents of this idea are great, is because their minds are stored with information beyond their fellows—and that gotten as much under the midnight lamp as in the laboratory."

As to the criticism that examinations mean squeezing out of facts of little service in every-day pharmacy; facts that are forgotten so soon as the examination is over; the question depends largely on the character of the examination. To expect a man to know the solubility of quinine salicylate in water and in alcohol is absurd, but to expect him to know the solubility of potassium iodide in water and of iodine in alcohol is entirely proper; since the latter information should be at hand on almost every day of prescription experience.

To use a simile taken from drug store experience, there are in every pharmacy, hundreds of articles for which there is scarcely a call in a year. Of course, these things can be card-catalogued, but after all, is not the most valuable man in the store the one whose memory is "long" enough to find these things on the instant, without recourse to the catalogue? It is a dictum in business that the man who has the most facts on his finger tips is more useful than one who has to "look it up" almost every time a question is asked him.

Hence the tremendous value of preparing for a final examination after one has spent the college years in acquiring knowledge by absorption. But one phase of study is essential to the other. The man who leaves all of his studying for the final cram has a poor mental equipment after the examination is over; but the man who "bones" for the final examination, after rational study during the college term clinches the facts so that they cannot wholly get away from him in after life.

But final examinations are but one of several means that the teacher should employ in forcing his pupils to do their very best. In fact, were final examinations the only way of getting students to work, the writer would be tempted to join the anti-examination ranks and to urge that haphazard absorption was the best means of acquiring knowledge. Students must be prodded every week, if not every day, of the college course, else the best of them will lag in their studies. The two ways to stimulate them to further effort are quizzes and tests.

As to quizzes every man who has spent time in college knows what they mean. A group of twenty-five to fifty students in a room with an instructor at the desk. Mr. Jones is called upon to recite and the rest either sleep or fool around, while Jones fishes about in the recesses of his mind for the answer. If Smith, Jones' neighbor is bright, the answer is apt to come from Smith or his book via Jones' lips. If the teacher is keen, the digression is detected and the class is regaled for five minutes with a "dressing down" of Smith. If the teacher is dull, the game is not detected and Jones gets a "perfect" mark for Smith's answer.

The writer has studied the quiz system both as a student and as a teacher, and each year he becomes more and more convinced of the utter futility of the oral quiz, either as a means of instruction or as incentive to study.

Each year he endeavors to put more and more of his quiz work upon the basis of written tests, for in these he finds the fairest, the most practical method of making students work. Of course, in large institutions the marking of several hundred test papers each week means a vast amount of work on the part of the instructor upon whom the task falls. It might be added that the chief object of this paper is to suggest to those in charge of the administration of college work, to see that the marking of answers to tests be made the daily—not nightly—routine work of the instructors.

One cannot blame an instructor who is given enough duties to keep him busy all day, if he is not enthusiastic about spending his evenings marking test papers. Nor is it surprising that following the line of least resistance, the oral quizzes go on to the amusement, if not to instruction, of the students they are supposed to benefit.

The writer thinks that in a pharmacy college the quiz hours should be devoted largely to written tests. He feels that each student should get a pharmacy test one week, a chemistry test the following week, a materia medica or botany test the third week, getting back to the pharmacy test the fourth week. In each department the quiz hour should be allotted something in this style: the holding of a test one week, the explanation of the test the next week; possibly an oral quiz the third week; while on the fourth week, a written test is again in order.

Should such a schedule obtain, the student must study during every week of his course and he can see week by week his chances of promotion; and if a man getting fifty to sixty percent in his tests cannot see that he is doomed to failure at the final examination unless he is willing to knuckle down to hard work, he has no one but himself to blame when success is not his.

If the plan of making tests an official part of the instruction prevails; if they are declared as essential to the well-being of the student as are the lectures and the laboratory courses; if they are given regular places upon the schedule and if the marking of the answers is considered as a part of the daily routine of the instructor in charge, the need for final examinations will become less and less until the importance of that now essential part of college instruction will finally reach the vanishing point and those advocating the abolition of the final examination will have their way.

### PROVIDING NEEDED EDUCATION.\*

---

ROBERT P. FISCHER, B. SC., PHAR D.

---

Providing education or rather post-graduate education is one of the professed functions of the American Pharmaceutical Association and in order to properly carry out such education, the Association has adopted the "extension" idea through its monthly journal and the Yearbook, both of which reach every member of the Association.

Without a doubt the needs of the members, as far as keeping in touch with pharmaceutical progress is concerned, are thus well taken care of; but there is

---

\*Read before Section on Education and Legislation, San Francisco Meeting.

a huge possibility for doing educational work which the Association is overlooking and which, if properly looked after, would, in the opinion of the author of this paper, bring considerable credit to the Association as a whole and indirectly to every member.

Pharmacy and pharmacists have too long been the subjects of many misconceptions on the part of the lay public and it is time that the public should be educated to respect the pharmacist and his profession even as it has been taught to respect the physician and the practice of medicine.

No one will dispute that most of the "stories" implicating the entire drug trade in the dope traffic and other nefarious business originate in the public press, and when such "stories" appear, they are scarcely if ever replied to with the true facts by the members of the profession which is thus unjustly attacked.

The remedy for this condition is not as difficult as it may at first appear, although it may at times prove to be a slow process. It simply requires a further extension of our system of education such as the Journal of the American Medical Association has been carrying on with increasing success for several years.

The plan followed by the Association mentioned is briefly this: Selecting from each issue of the Journal a number of articles which have a news value to the general public, printing them on sheets of paper which can be conveniently folded and wrapped and mailing these so-called "Press Bulletins" to newspapers. If the articles selected for the "Press Bulletin" are short, as they originally appear in the Journal, they are printed in full and if too long they are abstracted. The phrase, "says the Journal of the American Medical Association," is inserted at some convenient place and the article as sent out is in such shape as to require very little if any editing by the newspaper men.

In the report on public education submitted at the 1915 convention of the American Medical Association, the following reference is made to the "Press Bulletin":

"The newspapers of the country are showing an increasing tendency to utilize this material and to credit the Association and the medical profession with sincerity and disinterestedness in its educational efforts. In January, the secretary, at the direction of the general manager, sent to each of the 4,912 names on the mailing list of the Bulletin a return postal card asking them to indicate whether they desired the Bulletin sent to them for the coming year; 2,302 replies were received, of which 102 asked to have the Bulletin stopped and 2,200 asked to have it continued. As this is the first time that any expression of opinion has been asked for, this evidence of a desire on the part of 45 percent of the newspapers on the list to have the Bulletin continued is ample evidence of its value."

What the Journal of the American Medical Association can do along these lines, can also be done by the Journal of the American Pharmaceutical Association.

The more real pharmaceutical news and information we furnish the newspaper men, the less sensational rot about pharmacy will they have space for. Modern successful newspapers want to publish correct information, and the chief reason why they are unable to do so in many instances is because some inexperienced reporter is assigned to a technical field which he cannot handle intelligently. "Press Bulletins" will in a large measure overcome this difficulty.

Of course, a judicious censorship would have to be exercised by our editor in preparing these bulletins.

Many of the editorials appearing in the *Journal* of the American Pharmaceutical Association, are well worth the layman's consideration and would go far toward setting pharmacy right with the public on a good many questions affecting both, but we cannot expect the busy editor of a daily paper to read our journal and thus get our point of view.

As for the papers, the argument will probably be advanced that they are too long for bulletin purposes, and that it would take too much of our editor's time to abstract them.

If the by-laws of this Association were lived up to in regard to the presentation of papers, an abstract would be prepared and handed in before the meeting, for Chapter X, Article III, of the by-laws, specifically states:

"Any person desiring to submit a paper to the Association<sup>1</sup> shall present to the Chairman of the particular section to which it refers, at least ten days prior to the meeting, an abstract of said paper, indicative of its contents, and consisting of not less than fifty or more than two hundred words. This abstract shall be printed as a part of the program."

An abstract of from fifty to two hundred words would be just about what would be required for the "Press Bulletin."

The custom of most scientific associations is to print abstracts of all or nearly all papers presented at their annual meetings in the issue of the *Journal* which immediately precedes the date of the meeting. This gives other members an opportunity to prepare for the discussion upon any paper that is to be presented.

It was doubtless intended by the framers of our by-laws that a similar arrangement should be followed by this Association and the abstracts prepared in accordance with the rules would thus answer the two-fold purpose of providing better discussions at the meetings and material for the "Press Bulletins."

---

### COÖPERATION A NECESSITY.\*

---

WHY SHOULD THERE NOT BE ACTIVITY BETWEEN THE MEDICAL AND PHARMACEUTICAL PROFESSIONS IN THIS DIRECTION?

---

JOSEPH P. REMINGTON, PH. M.

---

Coöperation, as we all know, is the act of working together to one end, and it would seem that the purpose of saving life, ameliorating suffering and promoting restoration to health are the principal objects of the medical and pharmaceutical professions. Coöperation has not always been the rule in the past, and there have been instances of open hostility between the professions recorded in history. The causes are not hard to determine.

Pharmacy was originally a part of medicine, but this was centuries ago and the word "apothecary" is frequently found in the Bible. When the medical pro-

---

<sup>1</sup> Recommendation adopted.

\* Read at Joint Session of the Section on Education and Legislation, Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy.

profession became divided and various cults or so-called "schools" of medicine came into vogue, solidarity was out of the question. The enormous growth of quack remedies had a most injurious effect in widening the differences between the doctor and the druggist. Sales agents of manufacturing pharmaceutical houses who introduce new medicines directly to the physician, and the dispensing of medicines directly to the patient by the doctor have provoked retaliation on the part of the druggist, and the cry is heard all over the land that doctors no longer write prescriptions. This, of course, is not literally true, but only partially so. This has had an unfortunate outcome and cases are easily cited where pharmacists have trenched upon the domain of the physician and have given advice to patients entering their stores, oftentimes with serious effects, for the pharmacist is not by training or education fitted to give medical advice or diagnose a case. We now see modern pharmacists in our large cities and towns and elsewhere supplying goods of a general character which cannot be classed under medicines or which especially aid in the cure of disease. These facts are well known. The patient who is sure to look out for the saving of expense frequently reads the advertisement of ready-made medicines, and, assisted often by the druggist, is induced to try the "cure-all." Proprietary medicines are not all inefficient. At the present time they are more unpopular than they ever have been, largely because the newspapers and public prints are educating the public to the iniquities of the advertising of these proprietaries. Physicians who write prescriptions largely in their practice do not as a rule like to enter a drug store which displays advertising cards, almanacs, dodgers, etc., recommending all kinds of medicines which claim to cure all kinds of diseased conditions.

A prominent physician of Philadelphia some years ago was treating a patient for rheumatism. The patient was well-to-do and perfectly able to engage the services of a physician. The doctor wrote a prescription, handed it to her, and directed her to an ethical pharmacist to have it filled. The woman had been buying coal oil, liquid glue, castor oil, paints, window glass, putty, etc., at low rates from a druggist who was rated as a wholesaler dealer in drugs. He did not hesitate, however, to put up prescriptions or sell anything. Upon the marble counter immediately in front of where she stood there was a pile of what are known as dodgers,—single sheets of paper of the cheapest character exploiting a remedy for rheumatism. The clerk in the store wrapped up the prescription bottle, containing a liniment, in one of these paper dodgers. It happened to be an advertisement of an oil largely used, with the front name of a saint. Arriving home, the patient used the doctor's liniment for several days with no immediate improvement. She had saved the dodger and, turning to it, she found that the quack medicine promised immediate relief. She went back to her druggist friend, procured a bottle, and the druggist chuckled at the success of his "silent salesman." There was a terrible time when the woman visited the doctor and refused to pay his bill, saying that if he could not make a better oil than the stuff that she could get which was so largely advertised, she would not only not pay her bill, but never go near him again. These facts were related to me personally by Dr. Atlee, who complained bitterly of the druggist and at the next County Medical Society meeting he proceeded to air his grievances before that body. Nothing ever came of it, however, as the druggist had not committed a legal

mistake, and it was not worth making a test case. Naturally, coöperation did not exist under such circumstances. Neither the doctor nor the druggist is living at present, but the druggist's business dwindled away, while the doctor's practice increased and he afterwards spoke of the incident as a joke on himself.

There are drug stores here and there which contain no patent medicine advertisements; there are many others which keep patent medicines, but they are out of sight and never displayed, simply because the proprietor regards it as bad business policy to encourage the sale of such proprietaries. The general ground which is taken by the druggists who sell proprietaries is that they are in the drug business. They believe that the public should get medicines from medicine stores. The druggist is compelled to give a State Examining Board proof of his fitness to dispense medicines. He spends considerable money and time in getting a diploma from a college of pharmacy. If the public cannot get medicines that they want from him, they will go elsewhere—possibly to a department store. As the prescription business has fallen away, the druggist adds to his stock many articles void of medicinal action, as kodaks, fishing tackle, fountain pens, etc. On general principle the public does not object; but the doctor cannot very well find a legitimate way of increasing his revenue. He is supposed to stay in his office and wait for patients when he is not out visiting the sick. He says, "The druggist is selling all kinds of medicines to his patients and counter-prescribing. Now why cannot I lay in a stock of tablets and other medicines and sell or give them to my patients?" Many times he can, and he works off the samples left by the agents of manufacturers, and, if he is criticised for this, he states that he cannot trust the druggist to fill his prescriptions accurately.

On the other hand, the druggist charges the physician with often giving his patient something that he has in stock and which is only pretty near what he ought to give, and he makes the disease fit the medicine. This represents the problems which exist at the present time and which have existed for many years.

Again, many pharmacists have tried from time to time to conduct a pharmacy strictly along the lines of catering to physicians only to find that support from the medical profession is very luke-warm, with the result that money is lost continually.

It would seem that the time is ripe for active coöperation between the two professions. The well educated pharmacist can prepare special medicines with combinations of ingredients which the doctor with the assistance of the pharmacist knows will suit a particular case which the doctor is treating. The patient has the right to expect, if he pays the doctor's fee, to get something to relieve his suffering which embodies all the knowledge and experience possessed by the doctor. Nothing disgusts a patient more than to find that the doctor has prescribed one of the largely advertised patent medicines which the patient knew all about before he went to the doctor's office. He pays three or four dollars for professional advice, but advice has already been given him in print on the advertisement or label of the patent medicine, and which he has read frequently in street cars or on the sides of barns. He thinks finally that the statements are highly colored, and hence he goes to a physician for a real, unbiased opinion and a prescription fitted exactly for his case.

If a propaganda could be started in favor of more prescription writing one of

the best arguments that I have used is that a doctor changes his medicine frequently, because of the stages which are well marked in a patient's condition. In treating the various fevers which are so common, the medicine which is at first used must be adapted to the patient's condition, and if the patient does not improve, he must modify or change the prescription entirely. Again, when the patient is convalescent, it would be highly improper to continue the medicine which was given at the on-set of the attack. The formula for a patent medicine never changes and the patient is not likely to get well if he takes the proprietary continuously during the progress of the disease. One never sees a cautionary notice on a patent medicine that if after trying a few doses it does not cure, one should call in a physician. The label rarely or never admits that it can fail and yet a life may be sacrificed if a good physician is not engaged and the medicine is not changed from time to time. A life is worth more than dollars.

It seems at the present time that physicians and pharmacists should join hands and assist each other. Many physicians are using the preparations of the United States Pharmacopœia and National Formulary and are getting excellent results. The National Association of Retail Druggists have been engaged for years in bringing about better relations between the professions by visiting physicians and endeavoring to influence them to use official preparations. It is undoubtedly true that if physicians would prescribe in general practice such official preparations as they can, leaving the prescribing of proprietaries and synthetics to special cases, much good would be accomplished.

If our medical colleges and universities would invite lecturers on pharmaceutical subjects to give to our medical students courses in modern pharmacy, the student would be at least helped in his medical practice, after he graduated, to understand and know the properties and doses of medicines that should be procurable at any drug store.

This is one way of promoting coöperation with the practice of medicine assailed on all sides by what are known as irregular practitioners. There could be a revival which would result in much good.

It might be possible for the American Pharmaceutical Association to appoint a commission consisting of physicians and pharmacists who would issue a well-worded circular asking coöperation on both sides.

## Contributed and Selected

### FORMALDEHYZED CAPSULES.\*

WILBUR L. SCOVILLE.

It is a matter of common knowledge that formaldehyde hardens gelatin solution, and in the course of a short time renders it insoluble in water. Within a few years there have appeared articles in pharmaceutical journals stating that gelatin capsules treated with formaldehyde were suitable for use as enteric capsules, i. e., as capsules which would pass through the stomach unchanged but would dissolve in the intestines. In most instances, the writers have given no specific formula for treating the capsules, nor have they stated the strength of formaldehyde which should be used or the length of time that the capsules should be treated.

One writer, however, directed that the capsules should be immersed in a ten percent solution of formaldehyde for five minutes.

The value of this treatment will be pointed out later.

Gelatin capsules and pearls containing medicaments, which have been treated with formaldehyde, have appeared on the market, and claim to be enteric. Whether there is very much demand for these the writer does not know, but they attracted the attention of medical men, and have received some endorsement.

It has seemed worth while, therefore, to test the method and to find the conditions most suitable for producing desirable results in treating gelatin capsules; so a little more than three years ago a series of experiments were made for this purpose.

It was quickly found that strong solutions of formaldehyde were not suitable because they produced a capsule which would not dissolve in a weakly-alkaline solution within 24 hours.

The treated capsules were tested by immersing them in 0.3 percent hydrochloric acid containing a little pepsin, and kept at a temperature of 37° to 38° C. The aim was to produce a capsule which would remain unbroken in this acid solution for at least three hours, but which would dissolve or disintegrate in a 0.5 percent solution of monohydrated sodium carbonate within three to five hours, at a temperature of 37° to 38° C.

Since the experiments were made mostly on filled capsules of the elastic or soft variety, the treatment consisted in immersing the capsules in formaldehyde solution of definite strength for a definite period of time, then draining and drying them without washing.

Ten percent solutions of formaldehyde were employed for the first experi-

\* Read before the Detroit Branch of the A. Ph. A., September 17, 1915.

ments, and immersion was made for periods varying from 30 minutes to one minute.

All capsules so treated proved to be insoluble in either the artificial gastric or intestinal juice, and were unsuited for enteric purposes. Weaker solutions gave better results, and after preliminary tests covering several weeks of time, an aqueous solution containing one percent of (absolute) formaldehyde was found to be the most suitable strength for the purpose. A further series of tests showed that the time that the capsules remain in such a solution is an important factor. It was soon learned that if the capsules were allowed to remain in the solution more than six minutes, they would not dissolve, nor soften sufficiently to break, in the alkaline solution in three hours.

It was next learned that the action of the formaldehyde on the gelatin is slow and that it continues after the capsules have dried. Thus-treated capsules which tested satisfactorily the day after they were made, were found to be very unsatisfactory a week later. That is they dissolved in the first test in the alkaline solution within two or three hours, but remained intact in it for three to five hours in the second test.

Experiments were therefore made in which the capsules were immersed for 5,  $4\frac{1}{2}$ , 4,  $3\frac{1}{2}$ , 3,  $2\frac{1}{2}$ , 2,  $1\frac{1}{2}$  and 1 minutes respectively.

On testing the next day it was found that all of these dissolved in the acid solution within one hour, and were therefore not enteric; but a month later the same capsules all resisted the acid solution for three or more hours, and those which had been treated more than  $3\frac{1}{2}$  minutes resisted the alkaline solution for 3 hours, while those treated 3 minutes or less broke or dissolved in the alkaline solution within three hours.

Two months later the tests were again repeated, and none of them were soluble in the alkaline solution in three hours, though a few broke.

These experiments showed that for the above treatments the action of the capsules could be relied upon for short periods of time, but they were useless for enteric purposes until a few days after treatment, and also after about two months' time.

Alcoholic solutions of formaldehyde were then tried, but did not prove satisfactory, the capsules breaking up and dissolving in the acid solution almost as quickly as the untreated capsules, even after five minutes' treatment in a 5 percent formaldehyde solution.

Another series of experiments was then made with 1 percent aqueous formaldehyde solution, the capsules being macerated for 60 seconds, 45 seconds, 30 seconds and 15 seconds respectively. Tested three days after treatment, all of these dissolved in the acid solution. After standing two weeks those which had been treated 15 and 30 seconds partly broke in acid solution within three hours, while the others resisted for three hours. All dissolved in the alkaline solution within one-half to two hours. Monthly tests on these during the first five months showed them all to be satisfactory for enteric use after the first month.

At the end of a year, those treated for 15, 30 and 45 seconds were still satisfactory, resisting the acid solution for three hours but dissolving in the alkaline

solution within three hours; the others were not soluble in the alkaline solution in three and one-half hours.

This seemed to prove that treatment of the capsules for 30 seconds by a one percent formaldehyde solution, at ordinary temperature, produces a satisfactory enteric capsule. But two years later, or three years after the capsules were so treated, they were found to be entirely insoluble in either the acid or alkaline liquids after nineteen hours. In the alkaline solution the capsules swelled and softened, but none broke. Those treated for 15 seconds acted similarly.

The inevitable conclusion is that the treatment of gelatin capsules with formaldehyde solution for enteric purposes has only a limited value.

For general prescription practice its value is limited by the fact that the capsules either do not become enteric for several days after treatment, or else become insoluble and unfit for use after three or four days.

If it be practical to prepare the capsules two weeks in advance of their use, then all that is needed is to immerse them in a one percent aqueous formaldehyde solution for 30 seconds, drain them quickly and dry them, then store for two weeks before using. Capsules so treated should not be employed after about a year, because they become wholly insoluble.

Within these limits the capsules have proved satisfactory both by tests in vitro and by chemical use. But it should not be forgotten that on long standing the capsules become wholly unfit for use.

LABORATORY, PARKE DAVIS & Co.

## THE EXTEMPORANEOUS PREPARATION OF CAMPHOR LINIMENT.

---

ROBERT WOOD TERRY.

---

Having noticed the article entitled, "A Medley," by George M. Beringer, Jr., in the August issue of the Journal, I would like to call your attention to a very simple and rapid method of preparing camphor liniment.

Mr. Beringer recommends the purchase of an almond grater to reduce the camphor to fine granules to which the oil is added and the mixture placed on a water-bath, when after fifteen minutes the camphor will be in solution, this being more rapid than by the official method in which coarser particles of camphor are used, the assumption being, presumably, that the more surface of the camphor exposed to the solvent action of the oil, the more rapid the solution; therefore, why not carry out this theory to its limit of practical application?

The following method I have used for three years and have prepared camphor liniment in less than ten minutes by this method: Place the camphor in a mortar and add sufficient chloroform or ether to reduce the camphor to an extremely fine powder, being sure no small lumps remain, and allow this to stand a minute with an occasional stir to facilitate the spontaneous evaporation of the solvent; then, add a small quantity of the oil and triturate until a thoroughly homogeneous mass

results; add another small portion of oil and mix again; transfer this to the bottle and rinse the mortar with the remainder of the oil; shake, and after standing three or four minutes the camphor will be in solution—provided, the camphor was powdered properly. Alcohol must not be used in powdering the camphor as this evaporates slowly as compared to the ether or chloroform, and, being almost insoluble in cotton-seed oil, it produces an undesirable cloudiness in the finished product.

Always weigh the oil unless its exact specific gravity is known. This will insure the finished product being the required strength.

The trace of chloroform or ether remaining will be of no importance and I can see no objection to this feature.

Another advantage of this process is that no camphor is volatilized resulting from the heating on a water-bath—a factor which might account for a weak preparation.

This method is not as good as the official method when camphor liniment is intended to be used for a subcutaneous injection, wherein the heating would tend to sterilize the oil, a desirable feature. So little camphor liniment is used for this purpose, and especially since ampuls of this preparation are on the market, that it would not be practical to prepare it by the official process just for this reason.

Before writing this article, I tried to find some mention of this method in print. The only mention found was that in Parrish's *Treatise on Pharmacy*, by Wiegand, 1884, page 808, which I will quote: "It is made very readily by reducing the camphor to powder with a small quantity of ether, and when thus divided a little more ether is added, which forms to a pasty consistence, when it will mix with great readiness with the oil. A slight exposure to the air in a shallow vessel removes every trace of ether."

## Proceedings of the Council

Second Session, 1914-1915\*

The second session of the Council of the American Pharmaceutical Association for 1914-15 was held at the Hotel Bellevue, San Francisco, Cal., on Monday, August 9, 1915, at 9:30 a. m., Chairman E. G. Eberle in the chair.

Present: Messrs. Alpers, C. E. Caspari, Claus, Dawson, Day, Eberle, Engelhardt, England, Freericks, Godding, Hynson, Koch, Mayo, Osseward, Snow, Thiesing, Whelpley and Wulling.

On motion of J. G. Godding, seconded by J. H. Dawson, the reading of the minutes of the first session of the Council for 1914-15, and the Council Letters issued since this date, was dispensed with.

Applications for membership, from Nos. 257 to 283, inclusive, were presented as follows, and the applicants elected:

No. 257. Philippe J. Begin, 103 Water St., Augusta, Maine, rec. by M. L. Porter and A. W. Meserve.

No. 258. Roy Edward Mann, 84 S. Main St., Brewer, Maine, rec. by A. W. Meserve and M. L. Porter.

No. 259. George W. Rankin, 107 Congress St., Portland, Maine, rec. by A. W. Meserve and M. L. Porter.

No. 260. Harley Roscoe Alden, 4 Lisbon St., Lewiston, Maine, rec. by M. L. Porter and A. W. Meserve.

No. 261. John Milton Groff, Cynwyd, Pa., rec. by J. W. Sturmer and F. E. Stewart.

No. 262. Joseph R. Sutter, 307 N. 3d St., Burlington, Iowa, rec. by George H. Schafer and J. H. Axt.

No. 263. Samuel Honigberg, 831 Chambers St., St. Louis, Mo., rec. by H. M. Whelpley and J. W. Mackelden.

No. 264. Charles M. Twining, The Cutler Laboratory, Berkeley, Cal., rec. by Fred I. Lackenbach and J. W. England.

No. 265. John W. Donaldson, 840 W. 27th St., Indianapolis, Ind., rec. by F. W. Meissner and Frank H. Carter.

No. 266. John Harper, 311 Main St., Great Barrington, Mass., rec. by John G. Godding and Theodore J. Bradley.

No. 267. George Milton McEckron, Monnett, Mo., rec. by Minnie M. Whitney and D. V. Whitney.

No. 268. Laird J. Stabler, 1122 W. 30th St., Los Angeles, Cal., rec. by Clyde M. Snow and Wm. B. Day.

No. 269. Wortley Fuller Rudd, 120 Corvardin Ave., Richmond, Va., rec. by Wm. B. Day and A. Bolenbaugh.

No. 270. Teodoro M. Gutierrez Gonzales, Libertad No. 75, Holguin, Cuba, rec. by Jose P. Alacan and J. G. Diaz.

No. 271. Alfred Richard Trimbach, 158 Horton St., Lewiston, Maine, rec. by Theodore J. Bradley and John G. Godding.

No. 272. Malcolm Earl Wilson, Sardis, Miss., rec. by H. M. Faser and Wm. B. Day.

No. 273. Hugo O. Peterson, 1921 Elliott Ave., S., Minneapolis, Minn., rec. by E. L. Newcomb and F. J. Wulling.

No. 274. Virgil T. McCroskey, 206 Main St., Colfax, Wash., rec. by C. W. Johnson and Edith Hindman.

No. 275. Fred D. Marr, 1124 Pacific Ave., Tacoma, Wash., rec. by C. W. Johnson and C. Osseward.

No. 276. Edwin T. Bodin, Bay City, Mich., rec. by H. C. Christensen and Wm. B. Day.

No. 277. William Thomas Whitlock, 423 Riverside Ave., Spokane, Wash., rec. by C. Osseward and H. E. Holmes.

No. 278. Reuben J. Botkin, 138 West 31st St., Bayonne, N. J., rec. by Otto Raubenheimer and Luke C. Hines.

No. 279. Morris Tobias, 56 Ave. B., New York, N. Y., rec. by Otto Raubenheimer and Luke C. Hines.

\* The first session of the Council for 1914-15 was held at Detroit, Mich., on August 29, 1914.

No. 280. Robert J. Frick, 634 W. Main St., Louisville, Ky., rec. by Linwood A. Brown and C. S. Porter.

No. 281. Charles Philip Valentine, 1511 Railroad St., Helena, Montana, rec. by Charles E. Mollet and Alexander F. Peterson.

No. 282. August E. Staffa, 116 Rogers Ave., San Antonio, Texas, rec. by Jacob Schrodt and W. Cousins.

No. 283. Pinkney McGill White, 833 N. Fremont Ave., Baltimore, Md., rec. by James A. Black and O. W. Muehlhaue.

The report of the Secretary of the Council was presented as follows:

*Members of the Council:*

GENTLEMEN—The Council held one session at the Detroit (1914) meeting and has transacted business by mail since.

Twenty-eight Council Letters have been issued, covering 83 pages, and 45 motions.

The members elected number to date 283; the number last year by the first session of the Council on August 24, 1914, was 394.

A synopsis of the motions of the Council is attached and will become a part of the records. The minutes up to June 21, 1915, (Council Letter No. 27), have been published in the Journal.

The membership of the Council numbers 41, of which 17 are representatives of Local Branches.

The three members of the Council elected by mail on November last, for 1915-16, were: Caswell A. Mayo, New York, N. Y.; F. M. Apple, Philadelphia, and Harry V. Army, New York.

Respectfully submitted,

J. W. ENGLAND, Secretary of the Council.

SYNOPSIS OF MOTIONS OF THE COUNCIL 1914-15.

Motion No. 1—Election of Council Committees for 1914-15. Carried.

Motion No. 2—Election of Members Nos. 1-2 inclusive. Carried.

Motion No. 3—Authorization of Committee on Publication to Effect a Reorganization and to Systematize the Work. Carried.

Motion No. 4—Election of Members Nos. 3-17, inclusive. Carried.

Motion No. 5—Petition to form Detroit Branch, A. Ph. A. Carried.

Motion No. 6—Election of Members Nos. 18-23 inclusive. Carried.

Motion No. 7—Petition to form Morgantown, W. Va., Branch, A. Ph. A. Carried.

Motion No. 8—Appropriation of \$1000 for Journal and \$400 for Printing, Postage and Stationery. Carried.

Motion No. 9—Election of Members Nos. 24-30, inclusive. Carried.

Motion No. 10—Election of Members Nos. 31-36, inclusive. Carried.

Motion No. 11—Time of Holding Sixty-third Annual Meeting of the American Pharmaceutical Association, i. e., week of August 9 to 14, inclusive. Carried.

Motion No. 12—Invitation to Canadian Pharmaceutical Association to meet in San Francisco in 1915 at about the same time as that fixed for the meeting of the American Pharmaceutical Association. Carried.

Motion No. 13—Change of title of Morgantown, W. Va., Branch, A. Ph. A., to West Virginia Branch, A. Ph. A. Carried.

Motion No. 14—Appropriation of \$230.68 for stenographic services for the Detroit meeting. Carried.

Motion No. 15—Election of Thomas F. Main as member of the Commission on Proprietary Medicines for term expiring 1919.

Motion No. 16—Appointment of Dr. James H. Beal as Chairman of Commission on Proprietary Medicines.

Motion No. 17—Extension of Invitation to Pharmaceutical Society of Japan to meet in San Francisco in 1915 at the same time as the A. Ph. A.

Motion No. 18—Election of Members Nos. 31-51, inclusive. Carried.

Motion No. 19—The Committee on Finance submitted the following for approval:

*Proposed Budget of Appropriations for 1915.*

Appropriation		
No. 1. Salaries		\$5,500
No. 2. Journal		6,600
(a) Publication	\$5,000	
(b) Clerical expenses	900	
(c) Postage and stationery	450	
(d) Freight, drayage and miscellaneous	250	

No. 3.	Printing, postage and stationery.....	900
No. 4.	Clerical expenses Secretary's office.....	416
No. 5.	National Formulary .....	1,000
No. 6.	Miscellaneous expense .....	100
No. 7.	Drayage, freight and expressage.....	100
No. 8.	Stenographers .....	350
No. 9.	Traveling expenses .....	600
No. 10.	Committee on Membership.....	250
No. 11.	Committee on Unofficial Standards.....	100
No. 12.	Year Book .....	2,500
No. 13.	Badges and bars.....	50
No. 14.	Certificates .....	50
No. 15.	Premium on Treasurer's bond.....	50
No. 16.	National Drug Trade Conference.....	200
No. 17.	Journals for Reporters.....	35
No. 18.	Section on Scientific Papers.....	25
No. 19.	Section on Education and Legislation.....	25
No. 20.	Section on Commercial Interests.....	25
No. 21.	Section on Practical Pharmacy and Dispensing.....	25
No. 22.	Section on Historical Pharmacy.....	50
No. 23.	Committee on Pharmacopœias and Formularies.....	25
No. 24.	Women's Section .....	50
No. 25.	National Syllabus Committee.....	25
		<hr/>
		\$19,051

At the Detroit (1914) meeting of the Association, the Section on Pharmacopœias and Formularies was abolished, but there was created, as a subdivision of the Section on Practical Pharmacy and Dispensing, a Committee on Pharmacopœias and Formularies.

Motion No. 20—Extending Invitation to Pharmaceutical Society of Japan to meet in San Francisco in 1915. Tabled.

Motion No. 21—Election of Members Nos. 52-58, inclusive. Carried.

Motion No. 22—Greetings to Pharmacists and Pharmaceutical Associations of other Nations.

Motion No. 23—Approval of General Rules of Publication of Council Letter No. 11. Carried.

Motion No. 24—Election of Albert Schneider, of San Francisco, as Local Secretary for 1915. Carried.

Motion No. 25—Disapproval of Proposed Exhibit at the Panama-Pacific Exposition.

Motion No. 26—Reply to Pearson's Magazine. Carried.

Motion No. 27—Election of Members Nos. 59-75, inclusive. Carried.

Motion No. 28—That action by the Council concerning the action of the Publication Committee in the matter of Editorship, be deferred until the next regular meeting of the Association, and that Mr. Marshall, the present Acting Editor, be given a hearing before the Council at that time. Not carried.

Motion No. 29—Election of Members Nos. 78-87, inclusive. Carried.

Motion No. 30—That E. C. Marshall be elected Editor of the Journal of the American Pharmaceutical Association. Not carried.

Motion No. 31—That the action of the Committee on Publication in the selection of Eugene G. Eberle as Editor and Advertising Manager of the Journal of the American Pharmaceutical Association, as reported in Council Letter No. 13, be ratified by the Council. Carried.

Motion No. 32—Appropriation of \$100 from Centennial Fund to Prof. Edw. Kremers for research work on medicinal plants and cultivated and wild plants. Carried.

Motion No. 33—Election of Members Nos. 88-101, inclusive. Carried.

Motion No. 34—Approval of Action of Committee on Publication in awarding the contract for printing the 1913 Year Book (Volume 2) to the Eschenbach Printing Company, of Easton, Pa. Carried.

Motion No. 35—That Mr. Marshall be paid for one week's service in April and be given three weeks' vacation with pay from April 7th at the same rate of salary he has been receiving as Acting Editor.

Motion No. 36—Election of Members Nos. 101-113, inclusive. Carried.

Motion No. 37—Award of Contract for Reporting 1915 Annual Meeting, A. Ph. A., at San Francisco to Lehnhardt & Co., of Chicago, Ill., as per estimate submitted.

Motion No. 38—Election of Members Nos. 114-131, inclusive. Carried.

Motion No. 39—Appropriation of \$50 for A. Ph. A. Buttons and Pins. Carried

Motion No. 40—Election of Members Nos. 132-171, inclusive. Carried.

Motion No. 41—Resignation of Local Secretary Albert Schneider.

Motion No. 42—Election of John H. Dawson as Local Secretary, to succeed Local Secretary Albert Schneider, resigned.

Motion No. 43—Approval of Program for 1915 Annual Meeting. Carried.

Motion No. 44—Election of Members Nos. 175-215, inclusive. Carried.

Motion No. 45—Election of Members Nos. 216-256, inclusive. Carried.

The report of the Committee on Revision of Constitution and By-Laws was presented, as follows:

### *Members of the Council:*

GENTLEMEN—Your Committee on Revision of Constitution and By-Laws would make the following recommendations:

1. Amend Chapter I, Article II, of By-Laws, last line, changing "one month" to "three months." The amended article will then read:

Article II. The Nominating Committee shall submit the names of three persons as candidates for each of the offices of President, First Vice-President, Second Vice-President, Third Vice-President and three members of the Council. These names are to be submitted by the General Secretary by mail to every member of the Association, together with a request that the member indicate his preference on a ballot enclosed for that purpose, and return the same within three months after the adjournment of the annual meeting.

2. Amend Chapter II, Article VII, adding after the word "Association" "within thirty days after his installation."

The amended article will then read:

Article VII. He shall appoint all committees, not provided for in the By-Laws or otherwise directed by the Association, within thirty days after his installation.

3. Amend Chapter VIII, Article V, of the By-Laws, first line, changing the word "five" to "three" and inserting the words "and state" after the word "local."

The amended article will then read:

Article V. All local and state organizations of Pharmacists shall be entitled to three delegates as their representatives in the annual meeting, who, if present, become members of the Association on signing the Constitution and paying the annual contribution for the current year. Provided, that the provisions of this article shall not be so construed as to reinstate any member whose name shall have been dropped from the rolls for non-payment of dues, nor shall anyone who has been expelled from the Association be received as a delegate. All credentials shall be sent to the General Secretary at least two weeks in advance of the annual meeting.

The subject of the membership of the House of Delegates will doubtless receive especial consideration at this meeting, and it will probably be well to await the decision of the Association on this subject, and then modify the amendment to suit the action taken, so that there shall be no conflict.

4. Amend Chapter XII, Article I, of the By-Laws, changing the words "twenty-five members" to "fifteen members."

The amended article will then read:

Article I. Local Branches of this Association may be formed whenever it may appear that fifteen members of this Association, in good standing, will participate, provided that no more than one such branch shall be formed in any one state, province, district or territory unless such branches shall be formed at a point distant one hundred miles or more from any branch already established in the same state, province, district or territory.

5. Amend Chapter III, Article II, fourth line, striking out the words "editing, publishing and distributing" and inserting in lieu thereof, the words "the distribution of."

The amended article will then read:

Article II. He shall keep fair and correct minutes of the proceedings of the general session, and carefully preserve, on file, all reports, essays and papers of every description presented to the Association, and shall be charged with the necessary foreign and scientific correspondence and with the distribution of the Report on the Progress of Pharmacy, under the direction of the Council.

The By-Laws of the Association provide that the Reporter on the Progress of Pharmacy shall edit the Report on the Progress of Pharmacy, and that the editing, publication and distribution of the latter shall be under rules and regulations approved by the Council. (Chapter VI.)

The By-Laws of the Council provide that (Chapter IV, Article II): "The Committee on Publication shall have charge of the editing, publication and distribution of the Report on the Progress of Pharmacy and the Journal of the Association, and such other publications as may be issued, under the rules and regulations to be approved by the Council."

By the amendment above proposed, the division of authority in the publication of the Report on the Progress of Pharmacy will be clarified, i. e., the Reporter on the Progress of Pharmacy will *edit*, the Committee on Publication will *publish*, and the General Secretary will *distribute*.

#### GENERAL RULES.

6. Rule 3. Proceedings of N. A. B. P. and A. C. P. F. in A. Ph. A. Proceedings, first line: Change the word "Proceedings" to "Journal of the American Pharmaceutical Association."

The rule will then read:

Rule 3. Proceedings of the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties in A. Ph. A. Journal: That space be annually set aside in the Journal of the American Pharmaceutical Association for abstracts of the proceedings of the meetings of the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties.

Rule 16. The Editor-in-Chief of the Journal shall be ex-officio Historian of the Association.

When the Historian was first elected, which was by resolution and not by by-law, the Association had no Journal and no Editor; now, it seems both fitting and logical that the Editor be made the Historian, and we so recommend.

#### GENERAL RULES OF FINANCE.

Rule 4. Deposits in Banks: Insert word "daily" before "deposit," and in lieu of words after bank state "whenever his receipts amount to \$100 or more."

The amended rule will then read:

"Rule 4. Deposits in Banks. The Treasurer shall make a daily deposit in the bank whenever his receipts amount to \$100 or more."

Rule 8. Auditing of Accounts of Treasurer and General Secretary. Use word "February" in place of "January" on last line.

The amended rule will then read:

Rule 8. Auditing of Accounts of Treasurer and General Secretary. The Treasurer and General Secretary having thus balanced their books and made out their reports, shall place all such books, accounts, vouchers, etc., with the report, at the disposal of the Chairman of the Auditing Committee at such time and place in February of each year as said Chairman may direct.

Rule 10. Meeting of Auditing Committee. Change word "January" in second line to "February," and "February" in next to last line to March.

The amended rule will then read:

Rule 10. Meeting of Auditing Committee. There shall be a meeting of the Auditing Committee in February of each year, and it shall be the duty of said Committee, at such meeting, to carefully examine all the books, accounts, vouchers, funds, etc., etc., received by them; and previous to the first day of March following, to make a report thereon, in writing, to the Chairman of the Council.

#### CODE OF ETHICS.

The Code of Ethics of the American Pharmaceutical Association was first published in 1853, and has not been published since. A copy is here attached. Changes have occurred during the past sixty-two years which make it desirable to change or amend some portions of the Code if in no other respect than phraseology. We, therefore, recommend that a special committee of three be appointed by the Chairman of the Council to revise the Code of Ethics, to report at next year's meeting of the Association.

Respectfully submitted,

J. W. ENGLAND, Chairman.

#### CODE OF ETHICS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The American Pharmaceutical Association, composed of Pharmacists and Druggists throughout the United States, feeling a strong interest in the success and advancement of their profession in its practical and scientific relations, and also impressed with the belief that no amount of knowledge and skill will protect themselves and the public from the ill effects of an undue competition, and temptations to gain at the expense of quality, unless they are upheld by high moral obligations in the path of duty, have subscribed to the following *Code of Ethics* for the government of their professional conduct.

Art. I. As the practice of pharmacy can only become uniform by an open and candid intercourse being kept up between apothecaries and druggists among themselves and each other, by the adoption of the National Pharmacopœia as a guide in the preparation of official medicines, by the discontinuance of secret formula and the practices arising from a quackish spirit, and by an encouragement of that *esprit du corps* which will prevent a resort to those disreputable practices arising out of an injurious and wicked competition. *Therefore*, the members

of this Association agree to uphold the use of the Pharmacopœia in their practice; to cultivate brotherly feeling among the members, and to discountenance quackery and dishonorable competition in their business.

Art. II. As labor should have its just reward, and as the skill, knowledge and responsibility required in the practice of pharmacy are great the remuneration of the pharmacist's services should be proportioned to these, rather than to the market value of the preparations vended. The rate of charges will necessarily vary with geographical position, municipal location, and other circumstances of a permanent character, but a resort to intentional and unnecessary reduction in the rate of charges among apothecaries, with a view to gaining, at the expense of their brethren, is strongly discountenanced by the Association as productive of evil results.

Art. III. The first duty of the apothecary, after duly preparing himself for his profession, being to procure good drugs and preparations (for without these his skill and knowledge are of small avail), he frequently has to rely on the good faith of the druggist for their selection. Those druggists whose knowledge, skill and integrity enable them to conduct their business faithfully, should be encouraged, rather than those who base their claims of patronage on the cheapness of their articles solely. When accidentally, or otherwise, a deteriorated, or adulterated drug or medicine is sent to the apothecary, he should invariably return it to the druggist, with a statement of its defects. What is too frequently considered as a mere error of trade on the part of the druggist, becomes a *highly culpable* act when countenanced by the apothecary; hence, when repetitions of such frauds occur, they should be exposed for the benefit of the profession. A careful but firm pursuit of this course would render well-disposed druggists more careful, and deter the fraudulently inclined from a resort to their disreputable practices.

Art. IV. As the practice of pharmacy is quite distinct from the practice of medicine, and has been found to flourish in proportion as its practitioners have confined their attention to its requirements; and as the conducting of the business of both professions by the same individual involves pecuniary temptations which are often not compatible with a conscientious discharge of duty; we consider that the members of this Association should discountenance all such professional amalgamation; and in conducting business at the counter, should avoid prescribing for diseases, when practicable, referring applicants for medical advice to the physician. We hold it as unprofessional and highly reprehensible for apothecaries to allow any percentage or commission to physicians on their prescriptions, as unjust to the public, and hurtful to the independence and self-respect of both the parties concerned. We also consider that the practice of some physicians (in places where good apothecaries are numerous) of obtaining medicines at low prices from the latter, and selling them to their patients, is not only unjust and unprofessional, but deserving the censure of all high-minded medical men.

Art. V. The important influence exerted on the practice of pharmacy by the large proportion of physicians who have resigned its duties and emoluments to the apothecary, are reasons why he should seek their favorable opinion and cultivate their friendship, by earnest endeavors to furnish their patients with pure and well-prepared medicines. As physicians are *liable* to commit errors in writing their prescriptions, involving serious consequence to health and reputation if permitted to leave the shop, the apothecary should always, when he deems an error has been made, consult the physician before proceeding; yet in the delay which must necessarily occur, it is his duty, when possible, to accomplish the interview without compromising the reputation of the physician. On the other hand, when apothecaries commit errors involving ill consequences, the physician knowing the constant liability to error, should feel bound to screen them from undue censure, unless the result of a culpable negligence.

Art. VI. As we owe a debt of gratitude to our predecessors for the researches and observations which have so far advanced our scientific art, we hold that every apothecary and druggist is bound to contribute his mite towards the same fund, by noting the new ideas and phenomena which may occur in the course of his business, and publishing them, when of sufficient consequence, for the benefit of the profession.

Recommendation No. 1 on Chapter I, Article II, of By-Laws, was amended to read:

Article II. The Nominating Committee shall submit the names of three persons as candidates for each of the offices of President, First Vice President, Second Vice President, Third Vice President and three members of the Council. These names are to be submitted by the General Secretary by mail to every member of the Association within three months after he receives them, together with a request that the member indicate his preference on a ballot enclosed for that purpose, and return the same by mail within one month after its receipt.

The amended recommendation was approved.

Recommendation No. 2 on Chapter II, Article VII, of By-Laws.

W. C. Alpers moved, seconded by C. E. Caspari, that the recommendation be approved.

H. P. Hynson moved, seconded by C. A. Mayo, to amend to provide that:

Article VII. He shall appoint all committees provided for in the By-Laws at the time of his installation and all committees not provided for in the By-Laws within thirty days after his installation.

J. H. Beal, seconded by J. A. Koch, moved as a substitute for the original article an additional clause to read as follows:

Article VII. He shall appoint all committees, not provided for in the By-Laws or otherwise directed by the Association. He shall announce the names of the appointees of such committees, as far as possible, at the time of his installation or within thirty days thereafter.

The original motion and the amendment being withdrawn, the substitute motion was adopted.

Recommendation No. 3 on Chapter VIII, Article V, of By-Laws was considered, and on motion of C. A. Mayo, seconded by H. P. Hynson, action was deferred for the present.

Recommendation No. 4 on Chapter XII, Article I, of By-Laws was approved.

Recommendation No. 5 on Chapter III, Article II, of By-Laws was approved.

Recommendation No. 6 on General Rule No. 3 was approved.

A new rule was proposed (No. 16) by the Committee to read as follows:

Rule 16. Editor as Historian: The Editor-in-Chief of the Journal shall be ex-officio Historian of the Association.

Approved.

Under "General Rules of Finance" a number of changes were proposed, the amended rules to read as follows:

Rule 4. Deposits in Banks. The Treasurer shall make a daily deposit in the bank whenever his receipts amount to \$100 or more.

Approved.

Rule 8. Auditing of Accounts of Treasurer and General Secretary. The Treasurer and General Secretary having balanced their books and made out their reports, shall place all such books, accounts, vouchers, etc., with the report, at the disposal of the Chairman of the Auditing Committee, at such time and place in February of each year as said Chairman may direct.

Approved.

Rule 10. Meeting of Auditing Committee. There shall be a meeting of the Auditing Committee in February of each year, and it shall be the duty of said Committee at such meeting, to carefully examine all the books, accounts, vouchers, funds, etc., etc., received by them, and previous to the first day of March following, to make a report thereon, in writing to the Chairman of the Council.

Approved.

The recommendation of the Committee on Revision of Constitution and By-Laws to revise the Code of Ethics was, in the light of information given by W. C. Alpers, amended to provide that a special committee of three be appointed, by the Chairman of the Council to inquire into the subject of the Code of Ethics and report at the next annual meeting. Dr. Alper's belief was that the Code of Ethics has been superseded, some ten years ago, by the "objects" stated in the Constitution.

Under "General Rules of Finance," H. M. Whelpley suggested the deletion of Rule 12, which reads as follows:

Rule 12. Publication of Names of Members. The Treasurer shall furnish with his annual report an alphabetical list of the names of the members from whom he has received money for dues and certificates during the financial year for publication in the Proceedings.

On motion of C. A. Mayo, seconded by F. J. Wulling, it was agreed to delete Rule 12, and properly number the succeeding "Rules."

Wm. B. Day moved, second by H. M. Whelpley, to have amended Chapter III Article I, of the By-Laws of the Council by adding the words "and the amount of his expenses incident to the meeting, in addition to his salary."

The article will then read:

Article I. The Secretary of the Council shall keep fair and correct minutes of the proceedings of the meetings and carefully preserve all reports and papers of every description

received by the Council. He shall receive an annual salary not to exceed \$300, and the amount of his expenses incident to the meeting, in addition to his salary.

Approved.

W. C. Alpers proposed, seconded by W. B. Day, that Chapter II, Article VIII, of By-Laws be amended, deleting the words "and countersign all orders on the Treasury."

The amended article will then read:

Article VIII. He shall sign the certificates of membership. He shall obey the instructions of the Association, and authenticate by his signature, when necessary, its proceedings.

Approved.

H. M. Whelpley suggested that Article I of Chapter IV of the By-Laws be deleted, and on his motion, seconded by Charles E. Caspari, the change was approved; the succeeding numbers of the articles to be properly renumbered. It was further agreed that the word "He" at the beginning of the present Article II, should be changed to "Local Secretary."

The article as amended would then read:

Article I. The Local Secretary shall assist the General Secretary in his duties; shall co-operate with the Council and any Local Committee in making arrangements for the annual meeting; shall correspond with the chairman of the several committees, and with other members in advance of the meeting, for the promotion of its objects, and shall have the custody of specimens, papers and apparatus destined for use or exhibition at the meetings.

Approved.

Article III shall be made Article II.

Approved.

On motion of W. B. Day, seconded by J. W. England, it was decided to have amended Chapter III, Article III, of By-Laws, providing for notification of the President and Local Secretary when elected of the duties of their offices, etc., the article to read:

Article III. He shall read all papers handed him by the President for that purpose, shall call and record the ayes and nays, whenever they are required to be called, shall notify the President, Local Secretary and the chairman of every standing and special committee of his election or appointment, giving each a statement of his duties and such other information as may be of service.

The report of the Committee of the Council to consider the question of representation in and function of the House of Delegates was then presented as follows:

*To the Council of the American Pharmaceutical Association:*

GENTLEMEN—At the Detroit meeting, the Council appointed a Committee of three to consider the question of Representation in and Functions of the House of Delegates.

At a session of the House of Delegates, the Committee on Resolutions of that body presented the following resolutions which were adopted:

"WHEREAS, The usefulness of the House of Delegates during its two years' existence, not having been such as was expected at the time of its installation, it is important that something be done to increase this usefulness; therefore, be it

*Resolved*, That it is the sense of the House of Delegates that increased efficiency can be secured by making this body a permanent one instead of making its existence dependent upon the action of the Council."

When the above resolutions were presented to the Council, they were referred to the Council's Committee on Representation in and Function of the House of Delegates. The House of Delegates itself, likewise, appointed a committee to consider this subject.

Both of these committees have been endeavoring to determine upon a plan for the reorganization of the House of Delegates as a permanent organization. To define a distinct field of activity and usefulness for such an organization and to formulate rules of procedure by which it could properly exercise certain duties and authorities that would harmonize with the work of this Association and permit of a close co-operation of all of these allied pharmaceutical societies along lines that would not in the least detract from the objects, aims and purposes of the American Pharmaceutical Association.

As a permanent organization, the House of Delegates should become the means for co-ordinating the work and effectually combining the influence of the national, state and local pharmaceutical societies and for securing a closer affiliation among such associations and with the American Pharmaceutical Association.

The efficiency of such an organization will depend very largely upon the zeal of the executive officers selected and the enthusiasm and co-operation of the allied organizations. There are many topics discussed at the meetings of the state pharmaceutical associations, as well as in the local branches of the American Pharmaceutical Association and local pharmaceuti-

cal societies, that are of more than local interest as they affect the progress of the calling throughout the entire country. These questions of common interest should be carefully debated by the delegates of these various bodies in a national convention, where they could outline a course of action that would secure co-operation throughout the entire country. Such questions as uniform pharmacy practice acts, anti-narcotic acts, state laws affecting the purity of drugs, labelling, etc.; pharmaceutical educational problems such as preliminary education, standards for registration; reciprocity in registration, etc., are among some of those that may be mentioned as topics of common interest and not circumscribed by municipal or state boundaries.

Your Committee are of the opinion that the establishment of such a permanent delegate body should be determined at this time. As to the membership, we would recommend that it be limited to not more than three delegates from each local branch of the American Pharmaceutical Association, each state pharmaceutical association, each local pharmaceutical organization, pharmacy school, or alumni association of a pharmacy school. In addition, the officers of the American Pharmaceutical Association and of its Council and a delegation of three members selected by the Council, should be considered as *active members* of the House of Delegates, and any member of the American Pharmaceutical Association should have the privilege of the floor, even though not appointed as a delegate. Would it not be wise to also include as delegates a delegation from and the officers of the National Association of Retail Druggists and the National Wholesale Druggists' Association as these organizations have very many interests in common with those of pharmaceutical societies. No delegate should be permitted to officially act as a representative from more than one society at the same meeting.

As to the functions of the House of Delegates, these have been set forth in Chapter I, Article I, of the By-Laws of the House of Delegates of the American Pharmaceutical Association in the following language:

"A. To receive and consider the reports of delegates from the bodies which they represent in the House of Delegates.

B. Consider and report upon such resolutions, and upon such other subjects as may be referred to the House of Delegates by the Council (of the A. Ph. A.) or by the Association (A. Ph. A.) in general session, or by the various Sections (of the A. Ph. A.).

C. Make a final report of the business transacted by the House of Delegates to the final session of the outgoing Council at each annual meeting.

D. It shall have the authority to adopt all rules and regulations necessary for the proper conduct of its business and not inconsistent with the Constitution and By-Laws of the Association and the Council."

Your Committee are of the opinion that the functions to be exercised by the House of Delegates are fairly well defined in A and B in the article as quoted. If any fault can be found at all it would be with the improper reference, at times, of certain resolutions and subjects to the House of Delegates which were purely matters connected with the internal management of the American Pharmaceutical Association itself. Now that we have established a Committee on Resolutions of the Association, it will be easy for the Association in general session or for its Council, to properly refer to either body questions of reference.

The resolutions by which the House of Delegates was created at the Denver meeting and the paragraphs C and D of Article I of the By-Laws of the House of Delegates quoted above, indicate that the House of Delegates as originally conceived was to be, in effect, a section or a committee of the American Pharmaceutical Association, and its actions, rules and regulations were to be subject to report to and approval by the Council of the American Pharmaceutical Association. If the American Pharmaceutical Association is to continue to control and dominate the House of Delegates, then no material changes in the statements of paragraphs C and D are necessary.

On the other hand, it has been argued that the "House of Delegates shall be composed of delegates" from certain pharmaceutical associations who are "to have uniform and exclusive representation" in the proposed re-organized House of Delegates and they are to have "sole control" of this organization. This might be construed as intending to create a new and independent body. If such be the consensus of opinion, then, necessarily, changes must be made in the wording of paragraphs C and D.

Your Committee are of the opinion that the House of Delegates should remain as the House of Delegates of the American Pharmaceutical Association. The more close the affiliation of the allied pharmaceutical societies and the American Pharmaceutical Association, the more efficient should be the work accomplished in behalf of all of the societies thus associated.

The various allied organizations, such as the state pharmaceutical associations, should be encouraged to refer through their delegates to the House of Delegates, all questions of national import or of common interest to druggists. An examination of the proceedings of the state associations will demonstrate that there are many such questions that should be more thoroughly discussed and concerted action outlined thereon by some such national body as the House of Delegates.

Your Committee are, therefore, not prepared to recommend that any radical changes be

made in the definition of the functions of the House of Delegates. This question can probably be left to the future to decide what changes, if any, should be made in the wording of the functions as now formulated.

We would urge that the consensus of opinion on this subject, as demonstrated at this meeting, be made the basis for an amendment to the By-Laws which shall provide for the permanent establishment of the House of Delegates of the American Pharmaceutical Association.

Respectfully submitted,

GEORGE M. BERINGER, Chairman.

Discussion was had upon the subject of the report.

H. P. Hynson spoke at length, giving his views, being followed by J. P. Remington, W. C. Alpers and F. J. Wulling and others.

On motion of Dr. H. M. Whelpley, seconded by H. P. Hynson, the report of the Council Committee on Representation in and Function of the House of Delegates was referred to the House of Delegates, to be returned to the Council for further consideration.

The following report was presented and received:

*Report on Invested Funds of the Association.*

St. Louis, Mo., June 11, 1915.

*To the Officers and Members of the American Pharmaceutical Association:*

We, the undersigned, have, in accordance with Rule 8 of General Rules of Finance, examined the securities contained in the Association Box (4227) at the Title Guaranty Trust Co., St. Louis, and found the following:

*Ebert Legacy Fund.*

St. Louis Bond No. 766..... \$2,000.00

*A. Ph. A. General Fund Bonds.*

5 St. Louis City Reg. 4 percent Bonds, Nos. 705, 706, 707, 708, 709..... \$5,000.00

1 St. Louis City Reg. 4 percent Bond, No. 717..... 5,000.00

Total .....\$10,000.00

*A. Ph. A. Centennial Fund Bond.*

1 Mass. State Reg. 3 percent Bond, No. 1705..... \$1,000.00

*A. Ph. A. Life Membership Fund Bonds.*

1 Mass. State Reg. 3 percent Bond, No. 1701.....\$10,000.00

3 Mass. State Reg. 3 percent Bonds, Nos. 1702, 1703, 1704..... 3,000.00

Total .....\$13,000.00

*A. Ph. A. Procter Monument Fund.*

Certificate of Deposit, No. 62,205, dated January 2, 1915, International Bank of  
St. Louis, (Principal) ..... \$4,812.46

H. M. WHELPLEY,

Treasurer.

FRED W. SULTAN,

Member, Auditing Committee.

Subscribed and sworn to before me this eleventh day of June, 1915.

(Seal)

SIDNEY SCHIELE,

Notary Public, City of St. Louis, Mo.

The report of the Auditing Committee was presented and received:

REPORT OF THE AUDITING COMMITTEE.

*To the Officers and Members of the American Pharmaceutical Association:*

We have examined the books of Henry M. Whelpley and W. B. Day, respectively Treasurer and General Secretary of the American Pharmaceutical Association for the fiscal year 1914 and compared the records with the vouchers and found them correct. We have found a proper accounting for all of the funds of the Association. The cash balance to January 1, 1915, corresponds with the books of the International Bank of St. Louis and the registered bonds and certificate of deposit in the hands of the Treasurer.

Auditing Committee,

OTTO E. CLAU'S, Chairman,

FRED W. SULTAN,

ALFRED W. PAGEY.

St. Louis, Mo., June 11, 1915.

The report of the Commission on Proprietary Medicines was presented in abstract by Chairman James H. Beal.

On motion of F. H. Freericks, seconded by W. B. Day, the report was accepted and ordered to be reprinted in pamphlet form from the Journal and was referred to the Joint Session of the Sections on Education and Commercial Interests.

On motion of H. P. Hynson, seconded by J. W. England, it was moved that the General Secretary be authorized to vise hereafter for the Council the credentials of delegates to the Association.

The following reports were submitted and accepted:

*To the Council of the American Pharmaceutical Association:*

I have the honor to report on behalf of the Committee on Unofficial Standards that the following monographs have been adopted and forwarded to the Editor for publication in the Journal of the American Pharmaceutical Association in accordance with the resolution adopted by the Council.

Yours very truly,

GEORGE M. BERINGER, Chairman.

Pareira, Phytolacca, Pimenta, Plumbi Iodidum, Potassii Chloridum, Potassii Glycerophosphas, Prunum, Pulsatilla, Quercus, Quillaja, Renninum, Rhus Glabra, Rubus, Rumex, Salvia, Santalum Album, Sassafras Medulla, Scutellaria, Sodii Nitras, Tamarindus, Terebinthina, Viburnum Opulus, Xanthoxylum Fructus, Zea, Zedoaria.

*To the Council of the American Pharmaceutical Association:*

I have the honor of presenting a supplemental report on behalf of the Committee on Unofficial Standards.

I have transmitted to the Editor for publication in the Journal, in accordance with the instruction of the Council, the following monographs:

Ferri Pyrophosphas Solubilis, Ficus, Galega, Geranium, Gossypii Cortex, Hæmatoxylon, Hamamelidis Folia, Helianthemum, Ignatia, Kaolinum, Krameria Lappa, Leptandra, Lupulinum, Mangani et Sodii Citras, Mangani Hypophosphis, Mastiche, Melilotus.

Yours very truly,

GEORGE M. BERINGER, Chairman.

The following applications were received and the applicants elected:

No. 284. Emory W. Thurston, 4003 N. Griffin Ave., Los Angeles, Cal., rec. by Hayden M. Simmons and Wilbur J. Teeters.

No. 285. Bert George Dyne, Main St., Las Cruces, New Mexico, rec. by E. G. Eberle and Wm. B. Day.

No. 286. Hendery Allison, Kingsville, Texas, rec. by R. H. Walker and E. G. Eberle.

No. 287. B. L. Eicher, 74 E. 12th St., Chicago, Ill., rec. by Clyde M. Snow and Wm. B. Day.

Adjourned until Tuesday, August 10th, at 7:30 p. m.

J. W. ENGLAND, Secretary.

### THIRD SESSION, 1914-15.

The third session of the Council of the American Pharmaceutical Association for 1914-15 was held at the Hotel Bellevue, San Francisco, on Tuesday evening, August 10, 1915, at 8 p. m., Chairman E. G. Eberle in the chair.

Present: Messrs. Eberle, Freericks, Godding, Claus, Alpers, Whelpley, Gietner, England, Day, Osseward and Thiesing.

On motion, the reading of the minutes of the previous session was dispensed with.

The following applications for membership were presented and the applicants elected:

No. 288. Edward Sydney McKee, 2132 Linton Ave., Cincinnati, Ohio, rec. by Caswell A. Mayo and Frank H. Freericks.

No. 289. Leslie D. Robinson, 1314 Bay View Place, Berkeley, Cal., rec. by John M. Dawson and Albert Schneider.

No. 290. Fred Mueller, 2129 University Ave., Berkeley, Cal., rec. by John H. Dawson and Albert Schneider.

No. 291. Dr. Andrew D. Mouledons, 3622 Laurel St., New Orleans, La., rec. by W. B. Day and J. W. England.

No. 292. Joseph Thomas Balter, 3601 Magazine St., New Orleans, La., rec. by E. G. Eberle and J. W. England.

No. 293. Dr. Joseph Oswald Weilbaeher, 2100 N. Claiborne Ave., New Orleans, La., rec. by E. G. Eberle and J. W. England.

No. 294. Fred Dawson, Albany, Ore., rec. by John M. H. Laue and C. M. McKellips.

No. 295. Francis Albert Federer, 1015 University Ave., Madison Wis., rec. by H. A. Langenhan and Emerson R. Miller.

No. 296. Elgar Otis Eaton, 33 U. S. Appraisers Store, San Francisco, Cal., rec. by John H. Dawson and Wm. B. Day.

No. 297. Robert Fulton Troxler, Quarantine Station, Angel Island, Cal., rec. by Dr. H. M. Whelpley and J. W. England.

No. 298. John J. Mahoney, 500 Church St., San Francisco, Cal., rec. by Franklin T. Green and R. H. Bohmansson.

No. 299. John V. Breckenridge, Jr., U. S. Marine Hospital, Boston, Mass., rec. by A. M. Roehrig and F. T. Gordon.

No. 300. Charles Levin Morgan, Half Moon Bay, Cal., rec. by J. L. Lengfeld and E. G. Eberle.

No. 301. Ada Lee Howell, 191 S. Main St., Akron, Ohio, rec. by Mary L. Creighton and Zada M. Cooper.

The report of the Committee on Publication was presented as follows:

*To the Members of the Council:*

GENTLEMEN—*Printing N. F. (IV)*: Prior to the Detroit (1914) meeting the Committee on publication invited bids from eight of the most prominent book publishers of the country for the composition, electrotyping, printing and binding of the National Formulary (IV), and the communications were opened by the Committee at Detroit. The two lowest bidders were the J. B. Lippincott Company and Wm. J. Dornan, both of Philadelphia, the former being the lower, and to this company was awarded the contract, the Committee on Publication being empowered to make the necessary contract as soon as possible by reason of war conditions.

An advantageous arrangement has been made with the J. B. Lippincott Co., whereby the books can be printed, and then bound from time to time, as the demand requires and paid for only when bound. By this method, the amount of money to be paid out by the Association at one time is reduced to the minimum, and the indebtedness will probably never exceed one thousand dollars.

The first issue will be 5000 copies, subsequent issues as may be required. The book will number 400 or more pages. It will be bound in muslin, in buckram, and in buckram interleaved.

The book is now in press, and will be pushed to completion as rapidly as possible.

*Agency and Sale of N. F. (IV)*: At the Detroit (1914) meeting of the Association, the Committee on Publication was authorized to secure bids and make the necessary contract for the agency and sale of the National Formulary, Fourth Edition.

Invitations for bids were invited from six of the leading book distributing companies of the country. The Midland Publishing Company, of Columbus, O., and the J. B. Lippincott Co., of Philadelphia, were the two best bidders; the former being the more advantageous, the contract was awarded to that company.

The selling prices of the N. F. (IV) will be \$2.50 per copy for the muslin bound copy, \$2.75 for the buckram bound copy, and \$4.00 for the buckram interleaved copy. The buckram bound copy probably will be the most durable and the sale of this form of binding should be especially encouraged.

Sub-agents will be appointed in the cities of New York, Philadelphia, St. Louis, Chicago, and San Francisco, who will allow discounts as follows:

- 25 copies or less, 15 percent.
- 25 to 100 copies, not less than 20 percent.
- 100 copies (or more) not less than 25 percent.
- Single copies, full retail price.

*Year Book, 1913 (Volume 2)*: Bids for the composition, printing and binding of the Year Book, 1913, (Volume 2), were invited from the J. B. Lippincott Co., of Philadelphia, the Stoneman Press Co., of Columbus, Ohio, W. J. Dornan, of Philadelphia, and the Eschenbach Printing Co., of Easton, Pa.

The Eschenbach Printing Co. was the lowest bidder, and the contract was awarded to this company by the Committee on Publication, which action was approved by the Council (Council Letter No. 29, March 19, 1915).

*Advertising Manager of Journal*: It will be recalled that, on February 1, 1911, E. C. Marshall began service as Advertising Manager of the Journal, receiving a salary of \$125 per month and continued as such until June 1, 1911, when he was made Acting Editor and Acting General Secretary (by reason of the resignation by illness of Dr. James H. Beal as Editor of the Journal and General Secretary of the Association); receiving a salary of \$250 per month for the months of June, July and August, 1911.

*Editor of Journal:* At the Detroit (1914) meeting the matter of selecting an Editor for the Journal was referred to the Committee on Publication, with power to act, subject to the approval of the Council.

Mr. Marshall was then engaged as Acting Editor to serve from month to month until a permanent Editor could be chosen. This acting service began September 1, 1914, at a salary of \$187.50 per month.

At the Detroit meeting the position of Editor was offered to Eugene G. Eberle by the Committee on Publication, and he promised to decide later. He presented his formal application on December 1, 1914 (C. L. No. 13, January 4, 1915) and was unanimously elected by the Committee on Publication, which action was ratified by the Council (C. L. No. 18, March 4, 1915). Mr. Eberle assumed the duties of the Journal office on April 6, 1915.

Mr. Marshall was relieved from duty as Acting Editor on April 6, 1915, and given three weeks vacation with pay at the same rate of pay he had been receiving, which action was approved by the Council (C. L. No. 22, April 10, 1915).

*Salaries of Journal Officials:* At the time he presented his resignation, Dr. James H. Beal was being paid a salary of \$4000 per year as Editor and General Secretary, and E. C. Marshall was receiving a salary of \$1500 a year as Advertising Manager, a total of \$5500.

Editor Eberle is receiving a salary of \$3500 a year and General Secretary Day a salary of \$750 a year, a total of \$4250. We have thus been enabled to economize in the salaries to the extent of \$1250 per annum.

*Reading Pages of Journal:* The number of reading pages of the Journal in 1914 was 1758, and in 1913 was 1600, an increase of 158. In 1912 the number was only 1466. We believe that the number of pages per month can be reduced from 146 pages to not more than 128 per month without detriment and have instructed the Editor to do this whenever possible.

*Receipts for Journal:* The receipts of the Journal from advertisements were \$3564.05 and from subscription \$300.84 or a total of \$3864.89, an increase of \$469.09. The increased receipts were chiefly from subscriptions.

*Expenditures for Journal:* The expenditures for the Journal for 1914 were \$5863.32, plus the Editor's and General Secretary's salaries of \$3666.66 (from which should be deducted the salary of the General Secretary, estimate at \$750) which would equal \$2916.66 net, or a total of \$8779.98, being an increase in Journal-cost of \$397.49 and editorial-cost of \$783.53, or a total increase of \$1181.02.

*Net Cost of Journal:* The net cost of the Journal for 1914 was \$4915.09 and for 1913 was \$4203.16, an increase of \$711.93.

*Expenditures for Year Book:* The Year Book for 1913 (Volume 2) corresponding to Volume 61 of the former Proceedings of the Association will probably be distributed this month but the bills have not yet been received. The previous volume, issued in June, 1914, cost \$1718.99 for the printing and \$244.99 for the binding, or a total of \$1963.98, which including the salary (\$1200) of the Reporter on the Progress of Pharmacy, amounts to \$3163.98.

*General Rules of Publication:* At the Detroit (1914) meeting, the Committee on President's Address reported favorably upon the suggestion of President Beringer that the Committee on Publication be given enlarged powers for the conduct of its work, and the recommendation was referred to the Council. Later (C. L. No. 2, Oct. 2, 1914) the Council authorized the Committee on Publication to effect a re-organization and systematize its work, and the following "General Rules of Publication" were recommended by the Committee on Publication and approved by the Council (C. L. No. 12, Dec. 26, 1914):

#### *General Rules of Publication.*

1. All bills on account of the Journal shall be certified to by the Editor and sent as soon as possible to the Chairman of the Committee on Publication for approval and then sent by the latter to the General Secretary for payment in accordance with Article II, Chapter V, of the By-Laws, and Rule Third of the General Rules of Finance, except bills for postage, stationery, drayage, freight, expressage, miscellaneous and clerical expenses of the Office of the Journal (Petty and Clerical Expenses, Journal Office) which shall be paid as provided for in Rule 2 of these rules.

2. Bills for postage, stationery, drayage, freight, expressage, miscellaneous and clerical expenses of the office of the Journal (Petty and Clerical Expenses, Journal Office) shall be paid by check by the Editor of the Journal by the American Pharmaceutical Association in a bank to be approved by the Committee on Publication.

The Editor shall be bonded for \$500 at the expense of the Association.

The procedure for the payment of such bills shall be as follows: (1) at the end of each month, the Editor shall send all paid-and-receipted bills and cancelled checks, with an itemized bill or statement, to the Chairman of the Committee on Publication for approval; (2) After approval the Chairman of the Committee on Publication shall send the bills and checks to the General Secretary for payment in accordance with Article II, Chapter V, of

the By-Laws and Rule Third of the General Rules of Finance, and (3) the Treasurer shall send the Editor a check to cover the amount of the bills and thus increase the bank balance.

3. All bills on account of the Year Book, National Formulary and other publications of the Association shall be certified to by the person contracting the same and approved by the Chairman of the Committee on Publication and sent by the latter to the General Secretary before payment in accordance with Article II, Chapter V, of the By-Laws and Rule Third of the General Rules of Finance.

The advantages of this method are many. It is simpler than having a Treasurer of the Committee through which to pay bills and it does not require that one-fourth of the annual appropriation of each item of the work of the Committee shall be paid each quarter to the Treasurer. The present machinery for the payment of bills is continued, the only change being the control to be given to the Chairman of the Committee on Publication in the pay-appropriation of each item of the work of the Committee shall be paid each quarter to the Editor of bills. In addition, the items of the annual budget of appropriations will not need to be changed.

Furthermore, the \$300 is practically advanced or loaned to the Editor under bond and the bills are really not finally paid by the Association until the Treasurer sends the check each month to cover the amount of vouchers paid, so that the Association is protected in every way.

*Papers for the Journal:* Article II of Chapter X of the By-Laws provides that papers presented to the Association and its Branches shall become the property of the Association with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication.

This article has been the cause of some discussion by contributors as well as by those interested in other journals. The rule, however, has been liberally construed and the privileges of advance publications by other journals has been given whenever asked for.

The American Pharmaceutical Association must be fair to the authors of pharmaceutical papers, but it must, also, be fair to its own interests, which are the interests of *all* its members.

To abolish this By-law would be to seriously cripple the Journal and the interests of the American Pharmaceutical Association.

Dr. James H. Beal referred to this subject at the last annual meeting in his "Report of the Retiring General Secretary and Editor of the Journal." (Journ. A. Ph. A., 1914, 1252), and his opinion deserves careful consideration. He said that:

"The papers and communications presented at the annual meeting and before the local branches may be roughly divided into those which are of general or popular nature, and consequently interesting to the casual reader, and those of a strictly scientific character which, notwithstanding their great usefulness to the progress of pharmacy, appeal only to a limited class of technical workers. If the rule requiring the consent of the Publication Committee be abolished, the probable result would be that the papers of a popular character would receive early publication in other journals and, consequently would be considered stale when printed in the official Journal; while to the latter would fall the exclusive publication only of such papers as were of technical and scientific nature.

The rule reserving the exclusive right to first publication in the official organ is a common one among scientific and professional organizations, and as far as my observation extends, has never been seriously objected to except in the case of the American Pharmaceutical Association.

Unless very good reasons can be cited to the contrary, it would seem better that the present rule be continued, with the understanding that the Committee on Publication shall have liberal discretionary power to give consent to the prior publication in the other journals of the papers presented at the annual meeting and before the local branches.

It should be remembered in this connection, that the Journal is in no sense a competitor of other drug publications. The necessity for requesting permission to print a paper before its appearance in the Journal certainly does not impose any serious hardship, and since the Journal is an exclusive Association organ, and does not infringe upon the general field of drug journalism, there should be no more objection to quoting from its pages than to quoting from a government publication."

There has been some delay during the past year in the publication in the Journal of papers read before the Local Branches, due, largely to the changes in editorial management. The Cincinnati Branch submits the following motion with the view of correcting this condition:

"That it be the sense of this Association, that any paper presented before the Cincinnati Branch and recommended for publication in the Journal, be passed upon for acceptance or rejection within fifteen days, and reported back to the Branch."

There can be no serious objection to this motion. As a rule, the Editor should be able to accept or reject any paper sent him within fifteen days after he has received it.

But it is not always within his power to give immediate publication. He must cut his garment according to his cloth.

There is a bigger question involved, however, than the mere acceptance or rejection of papers, and it is fundamental. One of the most serious defects of pharmaceutical and medical papers generally, is their undue length. If authors could only be made to realize that the briefer a paper—all things being equal—the stronger. We had a paper recently of 40 pages—embodying a whole lot of good work—but the author could have made several excellent papers out of it.

We should have a rule limiting the length of papers for the Journal—excluding reports, statistics, etc. The Editor should be instructed to use discretionary power to abstract papers of undue length, to cut out tautology and repetition, and to delete matter foreign to the subject.

As Dr. F. J. Wulling expresses it: "The world is growing too busy to waste time with non-essentials. I have often suggested that every author of a paper should be required (not merely requested) to accompany his paper with a synopsis so written that its text would comprise about one-tenth or less than that of the paper itself, and embody in the concise form possible the gist of the paper. Readers could then determine by a perusal of the synopsis whether they want to go through the paper. Such a rule would result, I believe, in greater publicity for every paper."

It seems to us that Dr. Wulling's suggestion is most worthy and we recommend its adoption. We should have "Rules" not only for the acceptance and rejection of papers, and to give greater liberty of action to those who present papers, but also, to give the Editor discretionary power to cut-down the size of papers (of course, by co-operating with the author). By encouraging the preparation of briefer papers, a larger number of members of the Association could secure earlier publication of their articles.

Furthermore, we should take steps to encourage research work, especially by the members of Local Branches, so that more and more good work would be done, and more and more good papers would be written. It might be well to go a step further and that is, to follow the example of the American Medical Association, which issued last year a pamphlet entitled "Suggestions to Medical Authors" (price 10 cents) giving admirable suggestions for the proper preparation of a medical article. In like manner, we could issue a pamphlet for pharmaceutical authors; and it should be much appreciated.

*Semi-Monthly Issues of Journal:* The suggestion has been made to issue the Journal of the American Pharmaceutical Association semi-monthly, that is, to give in the first issue of the month editorials, articles and general and legal news, and in the second issue of the month reports of the Association, Section, Branch and Council proceedings and the Report on the progress of Pharmacy, similar to the former Proceedings of the Association, but no papers.

In other words, the first issue would be a Journal of original papers and pharmaceutical news and the second issue would be given over to the business of the Association, its Sections, Branches and Council.

The Committee on Publication has given very careful consideration to this suggestion, but it is of the opinion that the Association is not in a financial position at this time to consider the printing of a semi-monthly Journal. The expense of getting out another issue monthly, with the exception of the office expenses and the salary of the Editor, would be doubled. If the members of the Association could be persuaded to assist the Association in securing advertisements for the Journal and increase our revenues, then in the course of a few years, we might be in a position to consider the issuance of two journals a month, but the increase of revenue from dues through the accession of membership is entirely too slow to provide any large increase of funds.

Furthermore, there is one feature of our Year Book which cannot be too strongly emphasized, a feature which makes it distinctly superior to the monthly reviews of current, scientific literature, and this is, that the *Year Book gives all the subject matter of related character for the year in one place*, so that a comprehensive review or survey of the literature upon any one subject can be readily and quickly made without making extended references in different parts of twelve different issues.

Hence, the judgment of the Committee on Publication is against the issuance of a semi-monthly Journal.

*Lloyd Library—Stock of Proceedings, etc.:* In accordance with the decision of the Detroit (1914) meeting to accept with thanks the very generous offer of the Lloyd Library to care for the Proceedings, etc., of the Association, the publications in question have been delivered to the Lloyd Library, and General Secretary Day has made the necessary arrangements to store the historical and other matters of the Association not taken care of by the Library.

*Office of Journal:* A decision will have to be made regarding the future office of the Journal. Some three years ago the office was placed at Columbus, Ohio, to suit the convenience of Editor Beal, who resided at Scio, Ohio.

Editor Eberle resides at Dallas, Texas, and this city is impossible, because of its remoteness from the center of population. The cities of New York, Philadelphia, Washington, D. C., Columbus Cincinnati, Nashville, St. Louis and Chicago have each been suggested to

the Committee on Publication, but the latter prefers that the Council itself should decide, feeling, however, that the fullest consideration should be given to the wishes of Editor Eberle.

Respectfully submitted,

J. W. ENGLAND, Chairman.

On motion of C. Osseward, seconded by Otto F. Claus, the report was received and approved and the question of the future office of the Journal was discussed and the selection of the same referred to the Editor and Committee on Publication with power to act.

The report of the Commission on Proprietary Medicines was taken up for consideration and adopted. It was directed that the report be set up at once in type and 1000 reprints be printed and the matter kept standing for an early issue of the Journal, so as to avoid delay in getting out the reprints.

On motion of F. H. Freericks, seconded by W. C. Alpers, James H. Beal was re-elected as a member of the Commission on Proprietary Medicines to succeed himself.

On motion of Dr. H. M. Whelpley, seconded by F. H. Freericks, James H. Beal was elected as Chairman of the Commission on Proprietary Medicines.

Secretary England stated that he had received a letter from Professor C. Lewis Diehl, regretting that his physical condition would not permit him to attend the San Francisco meeting and sending wishes for a very enjoyable and profitable meeting.

On motion of Dr. H. M. Whelpley, seconded by W. B. Day, the Secretary of the Council was directed to send to Professor Diehl the greetings of the Association and best wishes for recovery to health.

Adjourned until Wednesday, August 12th, at 7:30 p. m.

J. W. ENGLAND, Secretary.

## Editorial Notes and Announcements

E. G. EBERLE, Editor.....Columbus, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

### REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished reprints by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

- 100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.
- 200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.
- 50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.
- 100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.
- 200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.
- 50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.
- 100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.
- 200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

## IS PARTIALITY SHOWN IN ENFORCING THE HARRISON LAW?

We recently received a letter from one of the older members of the Association, whose sincerity in abiding by all laws will not be doubted, who recites that in the city where he resides inspectors under the Harrison law found errors in keeping account of narcotics.

They were advised that by paying \$25.00, no charges would be filed for violation. Rather than run the risk of prosecution, half of the druggists paid this sum, while the others did not, and were only admonished to be more careful in the future.

We are safe in assuming that our correspondent was not intentionally wrong, though there may have been technical violation of the law. The point however is the seeming partiality; if one was guilty and required to pay the fine exacted, the others were equally culpable and should have been shown no preference.

Not knowing the particulars in the case, we are not in position to speak further than that under the law there should be no partiality. Nor does the law intend for inspectors to entrap those who conscientiously seek to obey the law. Of course, being uninformed, or even mistakes, can not be plead as excuses for violation.

## WHITE SLAVERY, DRUGS AND LIQUOR

In what is very likely a syndicated article, a reverend gentleman considers the above in one class, as evidenced by the following quotation from the writing:

"The pitiless publicity of our day has revealed whole classes of men and women who seduce the unwary into sin. The entire hideous white slave traffic is made up of such. So is the drug business. So in a great degree is the liquor business."

Evidently, from the sequence and degree of expression, the latter is not as vicious as the drug business.

Possibly the writer had not anticipated a contradiction of his statements, or perhaps he did not think at all. He may have concluded from the fact that druggists do not often resent charges, that it is pleasing publicity for them. However, whatever may have been the surmise or delusion, Mr. W. H. Cousins, member of the American Pharmaceutical Association, replied to the effort

in another paper of the same Texas city, where this enlightening contribution was published in a Sunday edition. The reply seems to have had its effect, for in a number of papers, in various parts of the country, both of the North and South, explanations are attempted of what the writer "meant to say."

The, sometimes outrageous, insinuations directed against druggists as a class should be stopped. We are referring to this answer of Mr. Consins, because of the gentlemanly but convincing manner, in which the slanderous charges were refuted, and should be helpful in persuading contributors of messages to the reading public, that druggists as a class do not desire publicity of the kind printed in the quoted article.

#### SUBSTANCES WHICH MASK THE COLOR REACTIONS OF STRYCHNINE

E. Mameli (*Rep. de Pharm.*, 1915, p. 155) has found that phenacetin, paraminophenol, phenocoll, salacetol, protocathechuic acid, arsenomethylpyrocatechin, amylene-chloral, guaiacol, acetylguaiacol, heroin, helmitol, pyramidon, zinc phenolsulphonate, glycerin, and hydrochloric acid, are capable of affording color reactions like those given by strychnine, one of the reactions, Otto's, being the violet color obtained on contact with potassium dichromate and sulphuric acid; and the other, Mandelin's, being the blue-violet color afforded by a solution of ammonium vanadate in sulphuric acid, the color changing to rose-violet, then pink, on allowing to stand or on adding water. The author believes there are probably other substances which act likewise. The only method of avoiding error in toxicological analysis hence, is to separate the strychnine, by means of suitable solvents, in a pure condition.

#### Obituary

##### SIDNEY WILLETTE.

Sidney Willette, Ph. G., died at his home in St. Louis, July, 1915, after an extended illness. Mr. Willette was in business at 4201 N. Eleventh street. He was much interested in his work and was building up a fine trade. His classmates join other friends in extend-

ing sympathy to the bereaved relatives. Mr. Willette was a member of the American Pharmaceutical Association.—Meyer Bros. Druggist.

##### JULIUS KOLSCH

Julius Kolsch, one of the most prominent pharmacists of Colorado, died at Leadville, Col., on July 7, 1915, after a two years' siege of cancer of the throat.

Mr. Kolsch has been actively engaged in pharmacy since February, 1889, and had built up one of the finest retail drug stores in the West. He was a member of the Colorado State Pharmaceutical Association, and of the Masons, Elks and German order of Haurigauri.

A widow and three children survive him, Mrs. Elizabeth Kolsch, Frank A. Kolsch, with Frederick Stearns in Washington, Mrs. C. S. Gray, and Harry Kolsch, to whom the Kolsch Pharmacy in Leadville succeeds.

J. W. E.

#### Societies

##### AMERICAN CHEMICAL SOCIETY.

The Fifty-first Meeting of the American Chemical Society was held in Seattle, Wash-

ington, August 30 to September 3, 1915, inclusive. The registration showed the presence of 106 members and 119 guests.

The meeting was opened by an address of welcome by the President American Chemical Society, Dean of the University of

CHAS. H. HERTY,  
President American Chemical Society

Washington to which response was made by President Herty. A general meeting was then called to order and listened to an address by Leo. H. Baekeland on "Chemical Industry" and a second address by H. K.

Benson on "Industrial Resources and Opportunities of the Pacific Northwest." Following these addresses the Society continued in general session until noon of the following day holding public symposiums.

The Biological Division elected the following officers: Carl L. Alsberg, Chairman; I. K. Phelps, Vice-Chairman and Secretary; Executive Committee: W. D. Bancroft, Chairman; Edward Kremers, D. D. Van Slyke, A. W. Dox, A. D. Emmett.

The Division of Pharmaceutical Chemistry elected J. H. Long, Chairman; H. V. Arny, Vice-Chairman; Geo. D. Beal, Secretary; Executive Committee: F. R. Eldred and C. W. Johnson.

### RESOLUTIONS

Uniformity in antinarcotic laws was recommended and for the sake of greater definiteness in definition and to avoid inevitable confusion the words *synthetic substitutes*, wherever occurring in certain of the proposed drafts, be omitted, and that the same term where used in the national or so-called Harrison Act be eliminated by proper amendments of the Sections containing it.

It is moved that this resolution be given publicity through the Journal and by publication in *Science*.

The following resolutions, presented by the Division of Pharmaceutical Chemistry, concerning the so-called "variation clause" of the Federal Food and Drugs Act, were unanimously adopted by the Council:

WHEREAS, it is being proposed to repeal the so-called "variation clause" of the Federal Food and Drug Act of June 30, 1906, and of similar clauses in State Food and Drug Enactments, thereby making the United States Pharmacopœia and National Formulary the sole and only standards for all products in every case in which a title recognized in the United States Pharmacopœia and National Formulary is used, and

WHEREAS, the United States Pharmacopœia and National Formulary comprise only standards that are limited and are properly applicable only to drug and chemical products which have been specially prepared for use in pharmacy and medicine, and hence are not satisfactory and sufficient as standards for many non-medical and non-pharmaceutical purposes, such as the many uses in the industries and arts, and

WHEREAS, the insistence upon one invariable standard which might not, under any circumstances, be departed from, requires the unwarranted assumption that such standards are incapable of further improvement and would interfere with a proper freedom of choice by physicians in the selection of medicaments and likewise with the freedom of pharmacists and chemists in the development and introduction of new and superior therapeutic products; therefore,

It is the sense of the members of the Division of Pharmaceutical Chemistry of the American Chemical Society that the variation clause is a necessary and proper part of all Federal and State Food and Drug Laws, and that the repeal of said clause would result in great and unnecessary injury to the legitimate interest of pharmacy, medicine, and industries and arts employing chemicals.

The Invitation of the University of Illinois to hold the Spring Meeting of 1916 in Urbana during Easter week was unanimously accepted. The Council voted that time and place of the Fall Meeting for 1916 be left to the President and Secretary with the understanding that as soon as the constitutional limit of one year previous to the date of the meeting had been reached, the President and Secretary would announce New York as the place of the meeting as per previous understanding that the meeting should be held in affiliation with the American Association for the Advancement of Science.

A communication from Dr. H. V. Arny, chairman of the Committee on Weights and Measures of the American Pharmaceutical Association, requesting the co-operation of a committee from the American Chemical Society in behalf of a united campaign of education toward the ultimate adoption and use of the metric system of weights and measures in this country, was presented to the Council. The Council voted that the President should appoint a committee of five to co-operate with the committee of the American Pharmaceutical Association.

W. A. Noyes was re-elected editor of the *Journal of the American Chemical Society* for 1916 and the old board of associate editors were re-elected with the addition of Dr. John Johnston. E. J. Crane was re-elected editor of *Chemical Abstracts*. M. C. Whitaker was re-elected editor of the *Journal of Industrial and Engineering Chemistry* and the same board of associate editors was re-elected with the addition of Dr. S. F. Acree.

The subject of the address of President Charles Holmes Herty was "Co-operation in Matters Chemical." He emphasized the importance of extended co-operation between schools, universities, organizations, the government, the chemists and spoke for the encouragement of the people of the United States in promoting the chemical industries.

# FIRST NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

The First National Exposition of Chemical Industries was held in New York City during the week of September 20. In the following we are abstracting from the *Scientific American*.

The remarkable advance made in the production of chemicals and dyes in the United States during the past twelve months was much in evidence. Not only chemicals and dyes, but also the many requisites of laboratory equipment, heretofore supplied almost exclusively by Germany, were prominently featured.

In a general way the exhibits were divided into three main classes: First, chemicals, ores, metals, dyes, drugs, paints and other manufactured products of similar nature; second, apparatus and equipment for chemical laboratories, and third, machinery and equipment for manufacturing chemists, the treatment of ore and other purposes.

A miniature Rittman process apparatus commanded no little attention, due to the recent introduction of this discovery which came to the rescue of American dye makers at a very critical moment. With this process, gasoline, benzol and toluol are produced.

It was stated that the British Government has recently contracted for the entire output of toluol of the leading American producer for a period of several years. The price paid by the British Government is far beyond that offered—or could possibly be offered—by dye makers. However, it is believed that others will soon be producing the chemical for home consumption.

So it will be appreciated that the exhibits of the dye manufacturers were of particular interest, displaying as they did long rows of containers filled with dyes of varied colors. The American made chemical products also shared the keen interest of the visitors, since the commercial possibility of successfully replacing German chemicals was considered doubtful by many.

Laboratory glassware and porcelain ware now being manufactured in the United States were exhibited and it is claimed that the domestic products compare favorably with those of German manufacture, although it is admitted that the imported Jena glassware is still superior to any so far produced.

Made-in-America glassware and porcelain ware were shown in abundance.

The exhibit of the Bureau of Standards was most complete, not only in presenting the apparatus used in the laboratories of the Bureau, but also the chemicals, metals and ores recently tested.

The section devoted to weights comprised exhibits of materials used or being considered for use in the construction of weights, as well as the construction of different types of weights. There was also a facsimile of one of the two prototype kilograms of platinum-iridium, which were constructed and certified by the International Bureau of Weights and Measures and allotted to the United States, being brought here by special messenger in 1890.

## NEW OFFICERS OF NATIONAL WHOLESALE DRUGGISTS ASSN.

The new officers elected by the National Wholesale Druggists' Association at the Santa Barbara meeting are: President, Charles Gibson, Albany, N. Y., succeeding Chas. A. West; First Vice President, C. F. Michaels, San Francisco, succeeding Wm. J. Mooney;

CHARLES GIBSON  
Albany, N. Y.  
Pres. N. W. D. A.

F. E. HOLLIDAY  
New York City  
Sec. N. W. D. A.

Second Vice President, Joseph H. Brown, Little Rock, Ark., succeeding John R. Tague; Third Vice President, Dr. Adolph W. Miller, Philadelphia, succeeding F. E. Bogart; Fourth Vice President, C. A. Faus, Salt Lake City, succeeding John Phinizy; Fifth Vice President, H. R. Moore, Houston, Texas, succeeding John G. Mason; Board of Control: Jas. W. Morrison, Chicago, chairman; Chas. E. Bedwell, Omaha, Nebr.; Geo. R. Merrell, St. Louis, Mo.; L. D. Sale, Los An-

geles, Calif.; Frank C. Groover, Jacksonville, Fla.

Owing to the increasing detail of the treasurer's office, it was decided to elect a New York trust company to take charge of this work but pending completion of arrangements, the present Treasurer, S. E. Strong, Cleveland, Ohio, will be asked to continue in office. Resolutions of thanks to Mr. Strong for his long and valuable services to the association were adopted.

Francis E. Holliday was appointed secretary and Evans E. A. Stone, assistant secretary.

Baltimore was chosen as the next place of meeting.

## Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or type-written, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

### NEW YORK.

President J. Leon Lascoff called a special meeting of the New York Branch, A. Ph. A., for September 20, for the purpose of taking suitable action on the demise of the late President, John Roemer. A sketch of the life of the deceased appeared in the September issue of the JOURNAL.

The services were largely attended. Among the speakers were Dr. George Dickman, J. Leon Lascoff, James M. McCullough, of the Westchester County Pharmaceutical Association, and Dr. Henry T. Kelly, of the Westchester County Medical Association.

The principal address of the evening was made by Dr. H. T. Kelly, who said in part:

"The distinguishing characteristics of the man were his comprehensive knowledge, his broad view, his retentive memory, his dignified independence, and his kindness of

heart. He endeared himself to men in every walk of life, and his death is mourned as a friend and benefactor in many a home in the community in which he lived. His ceaseless industry and brilliant talents plainly indicate the power of his brain and evidence the fact that his knowledge was varied and extensive. There was embodied in his person a combination of rich intellectual gifts rarely to be found in one individual. \* \* \*

"His life was one of continuous toil, and his pleasures were wholly centered in his profession. Several evenings each week a little group of physicians would listen to him inculcate principles founded upon his own original observations, and hear the deductions from his inexhaustible store of pharmaceutical, scientific and philosophical knowledge. The impromptu forum which he conducted in the rear room of his pharmacy will always be one of the most hallowed recollections of my life. It was here that we learned *materia medica*. Infinitely more and better *materia medica* than was ever taught at college. There was an earnestness in his conversation, which seemed to carry the weight of conviction with it, and produced an indelible impression upon the memory. All the pharmacists and physicians who came within his sphere of influence benefited by his teachings. \* \* \*

"In a character so complex and diversified, one may be asked what was the dominant feature, what was the supreme quality, the one characteristic which stamped its impress upon the nature of the man. If I were to characterize his dominant moral and mental trait, I would say it was his love of truth. This, with his intense humanity and high sense of honor seemed to be the qualities which stimulated his mind, his heart, his soul, his whole life, with an energy and devotion which death alone could nullify."

### DETROIT

The Detroit Branch of the American Pharmaceutical Association met Friday evening, Sept. 17th, at the Wayne County Medical Society Building.

The meeting was called to order by President W. L. Scoville. The following gentlemen were appointed to the Membership Committee: F. F. Ingram, Jr., Chairman; E. R. Jones, C. A. Weaver, D. E. Perrin, Grant Stevens.

Mr. W. A. Hall gave a short talk on a method for estimating quickly the amount per dram of any drug in an N. F. or U. S. P. formula, the volume of which is one litre. The scheme is, add one seventh to the amount of the ingredients and divide by twenty.

The paper of the evening was by Mr. W. L. Scoville on Formaldehyzed Capsules. Mr.

Seoville has carried out a series of experiments on this subject over a period of several years. The capsules were treated with solutions of Formaldehyde of various strengths and then placed in acid and alkaline solutions similar to those of the stomach and intestine. The correct procedure for making enteric capsules was shown by this excellent paper.

Much discussion followed, every member present taking an active part.

Mr. Seoville also gave a very interesting description of the Meeting and the Fair at San Francisco.

A. A. WHEELER, Secretary.

<>

#### PHILADELPHIA.

The first of the 1915-16 winter meetings of the Philadelphia Branch was held Tuesday, September 21st, at the Medico-Chirurgical College.

The meeting was called to order at 8:30 by President S. C. Henry.

A communication from the New York Branch with an account of the death of their president, Mr. John Roemer, was read. A motion was read and carried that the secretary convey to the New York Branch our feeling of regret at the loss of such an able man.

Mr. Louis Gershenfeld was proposed and voted to be a member of our branch.

The program of the evening was then taken up.

Mr. Jos. W. England gave a report of the San Francisco meeting of the A. Ph. A. Mr. S. C. Henry reported the N. A. R. D. convention and, in the absence of Mr. Fischelis, Prof. C. H. LaWall gave an interesting account of the convention of the Pennsylvania Pharmaceutical Association.

J. ED. BREWER,  
Secretary.

#### TO BE USED TOGETHER.

A druggist lately received a hurried call from a small girl, who desired to purchase liniment and some cement.

"Liniment and cement?" repeated the pharmacist, puzzled by the unique order. "Going to use 'em at the same time?"

"Yes," promptly responded the youngster. "Ma she hit pa with a pitcher."—Chicago Ledger

### The Pharmacist and the Law

#### LEGISLATIVE AND LEGAL MATTER FROM THE REPORT OF THE COM- MITTEE ON TRADE INTERESTS OF PENNSYLVANIA PHARMACEUTI- CAL ASSOCIATION.

BY B. E. PRITCHARD, CHAIRMAN.

Mr. John C. Gallagher presented a paper before the New Jersey Association last year a portion of which is worthy of consideration in this report. Mr. Gallagher said:

"Recently there was a trial of a druggist in which one of the charges was that he had not labelled a poison with his name and address. The lawyer for the defendant tried to show by witnesses that it was the custom of the trade not to label with the name and address of the retail druggist, trade or original packages whose contents are poison upon which the name and address of the manufacturer appears together with the word poison. The judge refused to admit the testimony along that line for the reason, as he explained, 'that customs are very often illegal and in this case contrary to the text of the law.' It will be noted that this case was based upon a sale of a ready for sale package obtained from the manufacturing pharmaceutical house, such, for instance, as morphine and the various tablets and bichloride discs, etc. The poison law of Pennsylvania reads in part, as follows: 'No person shall sell at retail any poisons except as herein provided, without affixing to the bottle, box, vessel, or package containing the same a label, printed or plainly written containing the name of the article, the word 'poison' and the name and place of business of the seller. Thus while the incident related took place in another state, yet it is applicable alike to a similar transaction in this state.

At the September, 1914, meeting of the Pennsylvania Pharmaceutical Examining Board the condition was revealed through the reports of its investigators that cotton seed oil is frequently sold throughout the state upon calls for sweet oil, and the board directed attention of all dealers in this product to such labelling as being unlawful, and in violation of the Federal Food and Drugs Act

of 1906. Sweet Oil is the fixed oil expressed from the ripe fruit of the Olive tree and the only article which can be sold under that name without subjecting the seller to a charge of misbranding.

In this connection it seems wise to mention the presence in the market of a product labelled "White Wax No. 2," and the Pharmacy Board's investigators have reported a number of instances where it was delivered upon calls for white wax and so labelled. Analysis shows that white wax No. 2 is composed of 70 percent paraffin and 30 percent white wax. As it is labelled for what it is when sold by the jobber to pass it along by the retailer without similar precaution makes the latter liable without recourse. The presence of this adulterated wax in cold cream and ointment of rose water is likewise liable to make trouble for the seller.

Again, and following the same line of cautioning the retailer, Dr. Louis Emanuel, President of the State Pharmacy Board, presented a paper before the Pittsburgh Branch of the American Pharmaceutical Association in December in which he dealt with the action of the U. S. P. Revision Committee in retaining benzoinated lard as a base for zinc oxide ointment, and the opposition to the recommendation upon the part of numerous pharmacists because of its proneness to become rancid, which is not the case when petroleum is used. Dr. Emanuel called attention to the wide use of the petroleum base and warned the pharmacists of the State that its continued use may lead to prosecution under the Federal Food and Drugs Act as well as under the drug laws of a number of states of which Pennsylvania is one.

While dwelling upon the subject of the drug laws it becomes pertinent to mention the case in which a druggist in Fayette County was cited to answer a charge made by the pharmacy board against him, involving the sale of drugs that were not in accordance with U. S. P. requirements. In ruling upon this charge Judge Umbel declared that section three of the Pennsylvania drugs act is unconstitutional and dismissed the case on that ground. Section three reads in part: "For the purpose of this act an article shall be deemed to be adulterated, 1st., if a drug is sold under or by any name recognized by the U. S. Pharmacopœia, etc.....if it differs from the standard of strength, quality or purity as determined by the test or formula

laid down "in the text books named in the act." "2nd. If its strength or purity falls below the professed standard under which it is sold." Judge Umbel declared that to make this act constitutional the text of the several books named should form a part of the act. The pharmacy board, of course, promptly appealed from this decision. While not exactly bearing upon this case, yet it may be interesting to mention that this judge has since resigned under pressure and at the solicitation of the governor for certain acts unbecoming a judge on the bench.

As your committee is dealing with occurrences in a free-handed manner it may not be out of place to relate a rather humorous yet somewhat gruesome incident that was chronicled in a daily paper recently in which the denseness of some clerks—and it is not always the clerk alone—is made manifest. This item read:

"Robert Hoffman of Spring Alley was taken to St. Francis hospital yesterday, suffering from the effects of wood alcohol, taken, it is said with suicidal intent. Hoffman had asked the clerk in a drug store for carbolic acid. The clerk gave him wood alcohol, suspecting his purpose. Said clerk was lauded in this item for his sagacity in heading off a would be suicide. Wonder if that smart clerk ever read in his dispensatory that 'The treatment of Methyl Alcohol poisoning is very unsatisfactory.'"

The doctrine of Price Protection has during the past year been more persistently than ever before kept to the front through the activity of an organization known as the American Fair Trade League, the objects of which are:

1—To aid in the re-establishment and continuance of fair competitive commercial conditions.

2—To promote honesty in manufacturing, in advertising and in merchandising, for the mutual interest of the consumer, the middleman and the manufacturer.

3—To bring to the public attention the existing evils in merchandising methods which operate to the injury of society.

4—To act as a clearing house of information concerning trade practices and systems and legislation relating thereto.

5—To aid in securing the enactment and enforcement of laws, state and national, that will,—Prohibit and penalize unfair competi-

tion; Prohibit and penalize dishonest advertising; Prevent the elimination of the smaller business man by unfair methods.

6.—And to secure to the public the benefits and protection of stable, uniform retail prices upon all trade-marked and branded goods.

The League has been liberal in sending out literature broadcast for the purpose of arousing interest in securing the passage of the so-called Stevens Bill, a measure that has for its object the legalizing of price protection from manufacturer to consumer.

Dr. Frank Crane, the noted writer says:

"There are two ways of selling goods, the oriental or primitive way, is by haggling, and the modern way, which is by one price to all. The old way is suited to provincial life, to bazaars and small push carts, it never in the world could have produced big business because it is incapable of organization. The maker of a standard, trade-marked article ought to have the right to say how much the retailer should ask the public for it. The Supreme Court, by an amazing decision has said that it has not that right. The government compels railroads to maintain one price to all, why prevent the manufacturer from doing the same thing? The public has an erroneous idea that price agreement is a conspiracy against the consumer. Exactly the contrary is true. Price chaos evidently injures the consumer, and meanwhile puts the honest manufacturer out of business. The business of the United States ought to be on a sound basis. There is none other such than one price to all." In this connection I would like to present the manufacturer's view on the subject of price protection by quoting from a letter recently received from the managers of a nationally advertised toilet specialty, which comes direct from first hand:

"When the vicious price-cutter hammers the margin down to nothing, we cannot get volume of business, because the dealer simply cannot afford to carry our line. The price-cutter, as we generally find him selling for less than he has to pay for it, is not only guilty of unfair competition, but he is guilty of a waste of that of our good will and property values in our trade marks which some of the enlightened courts of the country have already recognized. I venture the assertion that within two years the Supreme Court will hold the manufacturer entitled to punitive damages against the dealer who infringes his good will value by this form of cutting."

During the current year there has been a renewed energy shown by the promoters of something for nothing schemes in endeavoring to fasten their demoralizing methods upon the retailers of the country, and our own State seems to have been specially seized upon by these brigands upon honest tradesmen as a ripe field for their nefarious game.

A bill was introduced in the last session of the legislature intended to place such a tax upon the promoting of and use of these deceptive schemes as would at least cripple them, the preamble to which read:

"Realizing that the sale or so-called giving of trading stamps, gift coupons, etc., is one of the principal causes of the high cost of living, as the consumer always pays for same and that the practice is a menace to the honest retail merchant, benefiting no one but the trading stamp companies, whom it enriches at the expense of the general public, We therefore pray that your Honorable Bodies—The House and Senate of the State of Pennsylvania assembled, enact the attached bill."

In common with other organized trade bodies the retail drug organizations of the state urged vehemently the passage of the bill—but it was buried in committee—through the usual method.

With reference to the above methods of securing trade the following analysis of how such schemes work out, taken from the May issue of the Western Pennsylvania Retail Druggist, may prove useful in deterring some retail druggists who do not think deeply from rushing into some of these deluding schemes:

#### QUI BONO?

Looking at the matter from a strictly business getting angle, of what use are the various alleged profitsharing schemes to the retail druggist? Even the most extravagant promoter will not assert that his method will add more than 25% to your present sales. Now figure it out for yourself. At the best your net earnings are not over 10%.

If your volume of sales is \$10,000 the increase promised will be \$2,500, which, even though it materializes, which is questionable, as your competitors are not asleep while you are working the game, it will only mean a net gain to you of \$250.00. The cost to you for the use of the system is usually 2½ per cent, which based on sales of \$12,500 would mean that for the privilege of earning an additional \$250.00 you pay out \$312.50 in

cash, while throwing in the time and labor involved in taking care of the \$2,500.00 increase as a bonus. Great scheme, what?

The emergency Stamp Tax Act passed at the last session of Congress and approved by the President October 22nd, is, or rather was until the Internal Revenue Commissioner and the Treasury Department began to grind out regulations, a measure filled with problems of a most complex character. It is the consensus of opinion that it is a piece of legislation that was entirely uncalled for, and only carried out as one more way out of the woods for the administration to cover up the damage done by the latest Tariff law. Analysis of its text shows it to have been most loosely and carelessly drawn, and reference to the various rulings issued by the Internal Revenue Department, taken in connection with the Act in its wording, shows many inconsistencies and incongruities and downright absurdities. We refer more particularly to that portion known as Section B—which carries that portion of the Act which bears particularly upon the drug trade.

One peculiar feature in connection with this Act of Congress is the fact that it became effective in detachments; that section bearing upon wines, liquors and cordials going into immediate effect, October 23rd; that section bearing upon tobacco and cigars taking effect on November 1st; while Section B—in which toilet preparations, etc., are included did not become effective until December 1st.

As originally drafted Section B included in its provisions proprietary or so-called patent medicines, but the earnest protests from the retail druggists of the country that fell upon Congress like an avalanche was irresistible, and at the last minute caused the elimination of that feature, and that fact has been largely responsible for the many problems that have been troubling both the department officials and the retailers ever since the law became effective. It is said that there never has been a law enacted by Congress—except the Harrison Narcotic Law—that has so taxed the powers of the Internal Revenue Department to make plain. The department has been literally overwhelmed with the flood of inquiries for information. These came in such numbers that in many instances the

officials in their replies and regulations unwittingly reversed themselves, which has led to much confusion. The law expires automatically December 31, 1915.

#### COMPULSORY REGISTRATION OF PROPRIETARY MEDICINES IN NEW YORK CITY.

The New York City Board of Health has formulated regulations, compelling the registration of the names of the ingredients of proprietary and patent medicines as a prerequisite for offering these preparations for sale in New York City.

The Department supplies official application blanks which must be signed by the applicant; these demand information as follows:

1. Name of preparation.
2. Name of applicant (specifying whether manufacturer, proprietor, importer, or distributor).
3. Location of manufacturer.
4. Form in which preparation is marketed.
5. Therapeutic effects claimed for preparation.
6. Names in English (not quantities) of ingredients to which the therapeutic effects claimed are attributed, and the names in English (not quantities) of all other ingredients except such as are physiologically inactive.
7. Exact text of all advertising matter and every statement set forth upon or contained in package, box, bottle or container as sold, and of the advertising matter relating to the said preparation contained in any circular, leaflet or book sold or distributed with or in conjunction with such preparation.

A sample of the preparation in the form in which it is to be sold or offered for sale in the City of New York, including the package, wrapper, label, box, bottle, container, and all advertising matter and statements shall be submitted with the application. Subsequent changes in form or text of labels, advertising matter or statements shall be filed with the Department of Health and shall be approved before use.

When such application is properly filled out and signed, together with the required sample of the preparation, shall have been filed with the Department of Health and the ap-

proval thereof given by the director of the Bureau of Food and Drugs and the sanitary superintendent, a certificate of registration shall be issued specifying the name of the preparation, the name of the person registering such preparation and the date. Every such registration certificate shall be numbered, which said number shall identify the particular preparation so registered and shall thereafter be affixed to the package containing such preparation.

Where the place of business of any person, firm or corporation filing an application under Section 117 of the sanitary code is elsewhere than in the City of New York such applicant shall furnish at the time of filing such application with the Department of Health, the name of a person, firm or corporation resident in or having a place of business in the City of New York, as the agent or representative of such applicant. Any notice to or dealings with such agent or representative shall be as effective as if sent to or made with such applicant.

#### WRONGFUL USE OF NAME.

In a suit for injunction by Thomas A. Edison, the well-known inventor, it was sought to restrain the defendant from using the complainant's name and picture, and a certificate over his name, alleged to have been authorized by him, on the bottles and cartons containing a medical compound. It appeared that in 1879 the complainant discovered or invented a preparation which he thought would be useful as a neuralgia remedy and applied for a patent on it. While the application was pending, he sold his rights to three persons. For some reason the patent application was abandoned, at the instance, it was said, of Mr. Edison. The defendant said that Mr. Edison verbally agreed that, if the patent application was not prosecuted to issue, that the product might be marketed under his name, with his picture upon the wrapper or cartons of the bottle in which the mixture was offered for sale, and that a certificate reading, "I certify that this compound is made according to the formula devised by myself," appear on each bottle or its wrapper. The assignees of the rights formed a New Jersey corporation to exploit the remedy. The company was not a suc-

cess and the rights passed through several hands before they were assigned to the defendant, in the course of which time Mr. Edison, in 1907, obtained, in the New Jersey courts, an injunction against the use of his name in connection with the alleged remedy. In 1912, the defendant proposed to market the compound under the name of Edison's Polyform with a certificate and trade-mark. Mr. Edison, on being informed of this, denied the existence of any right to the term "Edison's Polyform," and stated that he would not permit the use of his name in connection with Polyform, or recommend the formula, and he was willing to litigate the question to any extent. Notwithstanding this warning the defendant proceeded to market the formula in cartons which reproduced the old picture and the alleged certificate. Mr. Edison promptly instituted suit in the New York courts.

It was held that unless Edison made the verbal contract alleged in the defendant's answer, the latter had not on any theory a shadow of right to do what it did, nor had it unless some title remained in the persons to whom he had assigned his rights. The court expressed its disbelief that any such contract as was alleged was ever made. Moreover, it held that such a contract as was alleged was absolutely personal to the three persons to whom Edison had assigned his rights, and was therefore not assignable. "The remedy," the court said, "is admittedly a compound of a number of dangerous drugs. A. may be willing to allow his name to be used for promoting the sale of such an article, provided it is manufactured and put on the market by some one in whom he has confidence. An agreement by him that B. may use his name for such a purpose does not imply any grant to the latter of the right to authorize some one utterly unknown to A. to do the same thing. Complainant is entitled to a decree enjoining the defendant from calling the compound by his name, and by any name of which his forms a part, and from putting his picture or any certificate purporting to come from him on any of its packages or in any of its advertising literature, or from in any wise holding out or suggesting that he is in any wise concerned or interested in the sale. A witness whose testimony defendant itself introduced says that the remedy is worth-

less, except for the value that the right to use complainant's world-wide reputation in advertising may give to it. Complainant no longer believes that the remedy is useful, or likely to accomplish the purposes for which it was intended. There is not sufficient evidence in the case that that which defendant is putting out is really compounded according to the original formula. If it is using that formula, it doubtless may have a right to say so. In view of the improper use it has already attempted to make of the complainant's name, it should not be allowed even to say that much, or say he was the inventor, unless that statement is accompanied with the further explanation that the complainant now thinks it is without merit. Such latter statement must in every case appear in immediate connection with the formula and be as conspicuously displayed."

Edison v. Continental Chemical Co., 220 Fed. 398.

#### IN A SAFE PLACE.

In some of the small town drug stores in the quarry districts of Indiana, you can buy anything from talcum powder to dynamite, says the Indianapolis News. Not long ago, a small quarry operator drove up to one of these stores. The man was in a buggy, and his wife was with him. Calling to the proprietor of the store, he said, "Jim, bring out that box I bought a while ago!"

The package was put into the buggy at the feet of the man and his wife. The latter eyed the box suspiciously.

"What's in that package?" she asked with some asperity.

"Now, never mind," said the husband; "that's not going to hurt you."

The evasion excited the wife's further suspicion. "Ed Spivens," she exclaimed, "that's a box of dynamite!"

"Well, what if it is?" said Ed. emphatically. "It won't do any damage unless it explodes."

"Ed Spivens," shrilled the woman, "if you think I'm going to ride six miles in a buggy with fifty pounds of dynamite at my feet you're a bigger fool than I thought you were! You have that man take that stuff right out and put it in the back part of the buggy, under the seat!"

## Council Business

### COUNCIL LETTER NO. 1.

PHILADELPHIA, PA., September 10, 1915.  
To the Members of the Council:

At the San Francisco (1915) meeting of the Association, it was decided that Professor C. Lewis Diehl be retained as titular Chairman of the Committee on National Formulary, but that there be created, by resolution, the position of Vice Chairman of the Committee, and that this official be given full authority to act as the chairman or acting chairman, until further change; Professor Wilbur L. Scoville was elected the Vice Chairman of the Committee on National Formulary.

The subject matter of the National Formulary, Fourth Edition, is in the hands of the printer and proof is being rapidly furnished to the members of the committee, but there are certain questions of detail that have not yet been determined.

Vice Chairman Scoville writes asking the Council to authorize the holding of a conference of the editing committee and near-by members of the Committee on National Formulary, at Philadelphia, during September or October, of this year, at the call of the vice-chairman of the committee, and that the traveling and other expenses of the members be paid at a total cost not exceeding one hundred dollars.

The members of the editing committee are Messrs. Scoville, Cook, Dunning and Beringer.

The vice chairman of the committee will consult personally, also, Messrs. Hall, Seltzer and Stevens of Detroit, LaWall of Philadelphia, and Arny and Raubenheimer of New York, so that more than one-half of the membership of the Committee on National Formulary can be consulted at a comparatively small expense to the Association; such conference will clarify the final details and facilitate the more rapid publication of the book.

*Motion No. 1 (Conference of Committee on National Formulary).* Moved by G. M. Beringer, seconded by C. H. LaWall, that a conference of the members of the editing

committee and near-by members of the Committee on National Formulary be authorized to be held at Philadelphia during September or October of this year, and that a sum not exceeding one hundred dollars be appropriated to pay the expenses of holding such conference.

*Motion No. 2 (Election of Members).* You are requested to vote on the following applications for membership:

- No. 1. Leonard R. Wagner, Bangor, Mich.,  
rec. by W. B. Day and J. W. Eng-  
land.
- No. 2. Fred Bailey, 175 Main St., Berlin, N.  
H., rec. by E. H. Lyford and Wm.  
B. Day.
- No. 3. Sylvia C. Alacan, 4528 Chestnut St.,  
Philadelphia, Pa., rec. by Jose P.  
Alacan and Jose Guillermo Diaz.
- No. 4. David M. Olmstead, 126 Plymouth  
Ave., S., Rochester, N. Y., rec. by  
Eugene L. Maines and H. W. Gard-  
ner.
- No. 5. Charles T. A. Witt, 195 Exchange  
St., Rochester, N. Y., rec. by E. L.  
Maines and William B. Day.

The following is a list of the members of the Council for 1915-16:

#### MEMBERS OF THE COUNCIL.

- Alpers, Wm., 11th St. and Central Ave.,  
Cleveland, O.
- Apple, Franklin M., 31st and Berks St.,  
Philadelphia, Pa.
- Army, H. V., 115 W. 68th St., New York,  
N. Y.
- Beringer, George M., 5th and Federal Sts.,  
Camden, N. J.
- Brown, Linwood A., 125 Transylvania  
Park, Lexington, Ky.
- Caspari, Charles, Jr., University of Mary-  
land, Baltimore, Md.
- Caspien, Charles E., 2108 Locust St., St.  
Louis, Mo.
- Chas., Otto F., 3513 Hebert St., St. Louis,  
Mo.
- Day, William B., 74 E. 12th St., Chicago,  
Ill.
- Eberle, Eugene G., P. O. Box 1539, Dallas,  
Tex.
- England, Joseph W., 415 N. 3rd St., Phil-  
adelphia, Pa.
- Fench, C. T. P., 614 W. Court St., Cin-  
cinnati, O.

Freericks, Frank H., 1215 Mercantile Li-  
brary Bldg., Cincinnati, O.

Godbold, Fabius C., 5601 Rosemary Place,  
New Orleans, La.

Goddling, J. G., 278 Dartmouth St., Boston,  
Mass.

Hall, W. A., 200 Griswold St., Detroit,  
Mich.

Hensel, Samuel T., 351 Mercantile Bldg.,  
Denver, Col.

Hilton, S. L., 1033 22nd St., N. W., Wash-  
ington, D. C.

Holzhauser, Charles, 53 Spruce St., Newark,  
N. J.

Hopp, Lewis C., 1104 Euclid Ave., Clevel-  
and, O.

Hynson, H. P., 423 N. Charles St., Balti-  
more, Md.

Kauffman, George B., 235 N. High St.,  
Columbus, O.

Koch, J. A., Pittsburgh College of Phar-  
macy, Pittsburgh, Pa.

LaPierre, E. H., 80 River St., Cambridge,  
Mass.

LaWall, Charles H., 39 S. 10th St., Phil-  
adelphia, Pa.

Lehman, Robert S., 375 3rd Ave., New  
York, N. Y.

Mayo, Caswell A., 66 W. Broadway, New  
York, N. Y.

McEllhenie, Thos. D., 259 Ryerson St.,  
Brooklyn, N. Y.

Rogers, Charles H., West Virginia Uni-  
versity, Morgantown, W. Va.

Ruddiman, E. A., 101 21th Ave., S., Nash-  
ville, Tenn.

Schneider, Albert, 723 Pacific Bldg., San  
Francisco, Cal.

Seoville, Wilbur L., 81 Melbourne Ave.,  
Detroit, Mich.

Snow, Clyde M., 71 E. 12th St., Chicago,  
Ill.

Stewart, Francis R., 11 W. Phil-Ellena St.,  
Philadelphia, Pa.

Weinstein, Joseph, 1771 Madison Ave.,  
New York, N. Y.

Whelpley, Henry M., 2312 Albion Place,  
St. Louis, Mo.

White, William R., 311 Grace St., Nash-  
ville, Tenn.

Wilkerson, J. A., 2036 Russell St., St.  
Louis, Mo.

Wilbert, M. L., 1621 35th St., N. W., Wash-  
ington, D. C.

Wulling, F. J., University of Minnesota,  
Minneapolis, Minn.

The following committees have been elected by the Council:

*Committee on Finance.*

J. A. Koch, Chairman, Pittsburgh, Pa.  
Otto F. Claus, St. Louis, Mo.  
E. H. LaPierre, Cambridge, Mass.

*Committee on Publication.*

J. W. England, Chairman, Philadelphia, Pa.  
Geo. M. Beringer, Camden, N. J.  
E. Fullerton Cook, Philadelphia, Pa.  
H. B. Mason, Detroit, Mich.  
F. J. Wulling, Minneapolis, Minn.

*Ex-officio Members*—The Editor, Reporter on the Progress of Pharmacy, General Secretary and Treasurer.

*Committee on Invested and Trust Funds.*

Wm. B. Day, Chairman, Chicago, Ill.  
E. G. Eberle, Dallas, Tex.  
Charles Holzhauer, Newark, N. J.  
H. M. Whelpley, ex-officio, St. Louis, Mo.

*Committee on Centennial Fund.*

John G. Godding, Chairman, Boston, Mass.  
Wm. B. Day, Chicago, Ill.  
J. A. Koch, Pittsburgh, Pa.

*Auditing Committee.*

Otto F. Claus, Chairman, St. Louis, Mo.  
F. W. Sultan, St. Louis, Mo.  
F. G. Uhlich, St. Louis, Mo.

*Committee on Transportation.*

Thos. F. Main, Chairman, New York, N. Y.  
William B. Day, Chicago, Ill.  
Lewis C. Hopp, Cleveland, O.  
H. M. Whelpley, St. Louis, Mo.  
Chas. G. Merrell, Cincinnati, O.  
Chas. Caspari, Jr., Baltimore, Md.  
Fred I. Lackenbach, San Francisco, Cal.  
E. Floyd Allen, Minneapolis, Minn.  
F. C. Godbold, New Orleans, La.  
W. S. Elkins, Jr., Atlanta, Ga.  
C. Herbert Packard, East Boston, Mass.  
F. W. Nitardy, Denver, Col.

The General Secretary and Local Secretary, ex-officio members.

*Committee on National Formulary.*

C. Lewis Diehl, Chairman, Louisville, Ky.  
W. L. Scoville, Vice-Chairman, Detroit, Mich.  
Clyde M. Snow, Chicago, Ill.  
A. B. Stevens, Ann Arbor, Mich.  
Otto Raubenheimer, Brooklyn, N. Y.

Leonard A. Seltzer, Detroit, Mich.  
Harry V. Arny, New York, N. Y.  
E. Fullerton Cook, Philadelphia, Pa.  
H. A. B. Dunning, Baltimore, Md.  
Samuel L. Hilton, Washington, D. C.  
Chas. H. LaWall, Philadelphia, Pa.  
Geo. M. Beringer, Camden, N. J.  
M. I. Wilbert, Washington, D. C.  
William A. Hall, Detroit, Mich.  
Adam Wirth, New Orleans, La.

*Committee on Unofficial Standards.*

Term expires  
Henry Kraemer, Philadelphia, Pa. .... 1916  
Eustace H. Gane, New York, N. Y. .... 1916  
B. L. Murray, New York, N. Y. .... 1916

J. W. ENGLAND,

Secretary of the Council.

415 N. 33rd St., Philadelphia, Pa.

UNITED STATES PUBLIC HEALTH  
SERVICE.

Partial list of changes of duties and stations of commissioned and other officers of the United States Public Health Service:

Pharmacist E. J. Thurston. Relieved from marine hospital, Evansville, Ind., and proceed to the marine hospital at Vineyard Haven, Mass., July 24, 1915.

Pharmacist E. B. Scott. Granted three days' leave of absence from July 19, 1915, July 17, 1915.

Pharmacist R. F. Troxler. Detailed to represent the service at the annual convention of the American Pharmaceutical Association, San Francisco, Calif., August 9-13, 1915, July 24, 1915.

Pharmacist W. H. Keen. Relieved from duty at Washington, D. C., and from special temporary duty at New Orleans, La., effective August 1, 1915, and directed to proceed to the marine hospital, Evansville, Ind., July 24, 1915.

Pharmacist J. Y. Breckenridge, Jr. Directed to return to station at Boston, Mass., July 24, 1915.

Pharmacist Ralph E. Knouse. Directed to report to the chairman of a board of commissioned medical officers at the marine hospital office, Galveston, Texas, July 26, 1915, for examination to determine his fitness for promotion to the grade of pharmacist of the second class, July 15, 1915.

Pharmacist Claude H. Parker. Directed to report to the chairman of a board of commissioned medical officers at the marine hospital, St. Louis, Mo., July 26, 1915, for examination to determine his fitness for promotion to the grade of pharmacist of the second class, July 15, 1915.

List of changes of station for the period ending August 31, 1915, in the cases of sergeants, first class, and sergeants, hospital corps:

## SERGEANTS, FIRST CLASS.

Samuel H. Leopold, from Ft. H. G. Wright, to Ft. Rosecrans.

Charles G. Manning, from Ft. Bayard, to Ft. George Wright.

Christopher Hermann, from the Presidio of Monterey, to Jefferson Barracks.

Francis W. Wickett, from Jefferson Barracks, to the Presidio of Monterey.

Edward D. Sykes, from the Hawaiian Department, to Ft. Flagler.

Robert A. Dickson, from the Philippines Department, to Ft. Riley.

George C. Doughlass, from the Philippines Department, to Ft. Barry.

Daniel C. Donovan, from Ambulance Co. No. 6, to Ft. Niagara.

Hugh R. MacCleery, from Field Hospital Co. No. 6, to Ft. Sam Houston.

Charles T. Loebenstein, from Ft. Screven, to the Canal Zone.

## SERGEANTS.

Arthur A. White, from Field Hospital Co. No. 3, to Ft. Ontario.

Erwin Duntley, from Ft. Ontario, to Field Hospital Co. No. 3.

Frank A. Dagitt, from West Point, to the Philippines Department.

John A. Strauch, from Douglas, Ariz., to Vancouver Barracks.

James A. Tremblay, from Ft. Niagara, to Ft. Ethan Allen.

Rex M. Davenport, from Ft. Jay to Ft. Oglethorpe.

Charles N. Abel, from Ft. DuPont, to Ft. Oglethorpe.

John S. Kelly, from the Hawaiian Department, to the U. S., on furlough.

Isidore I. Gershberg, from the Hawaiian Department, to the U. S., for discharge.

Harold Both, from the Philippines Department, to the Letterman General Hospital.

Hugo E. Lacher, from the Hawaiian Department, to the U. S., on furlough.

Thomas E. Bussey, from Ambulance Company No. 3, to Ft. Sam Houston.

Vernon F. Dotson, from the Philippines Department, to Letterman General Hospital.

Virgil L. Miller, from the Philippines Department, to the Eastern Department.

Barney A. Raczunas, from the Philippines Department, to the Eastern Department.

George A. Pippy, from the Philippines Department, to the Eastern Department.

Harry L. Woodard, from Ft. Hancock, to the Hawaiian Department.

Robert Murphy, from Ft. Barrancas, to the Hawaiian Department.

Patrick J. Skelly, from Plattsburg Barracks, to the Hawaiian Department.

Amory C. Cotchett, from Ft. McDowell, to the Hawaiian Department.

Francis E. Lynch, from Ft. Jay, to the Department Surgeons' Office, Eastern Department.

Neil M. Stewart, from Ft. H. G. Wright, to the Cantonment Hospital, Galveston.

Albert O. Miller, from Ft. Strong, to Ft. Williams.

Richard J. Howland, from Ft. Williams, to Ft. Strong.

Harry Brotherton, from Ft. Greble, to the Second Division.

John C. Gray, from the Second Division, to the Eastern Department.

Clarence E. Hoverter, from Ft. Douglas (Colorado Militia duty), to Ft. Jay.

Olaf C. Larsen, from Ft. H. G. Wright, to Ft. Niagara.

#### PHARMACIST

E. B. Scott, re-detailed for duty in the Bureau, effective August 31, 1915.

#### PROMOTIONS

Pharmacists R. E. Knouse and Clyde Ritter promoted to Pharmacists of the Second Class.

#### TWO DOCTORS.

Two Manhattan physicians were enjoying the breeze from the front seat on the "hurricane deck" of a Riverside Drive bus one bright afternoon recently, when part of their conversation was overheard. It ran like this:

"I performed an operation for appendicitis on the wife of a millionaire yesterday," said the stouter of the pair.

"Yes?" said the other. "What was she suffering from?"—Boston Advertiser.

### Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

**HENRY MILTON,**  
From 2342 Albion Place, St. Louis, Mo.  
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or type-written.

#### CHANGES OF ADDRESS SINCE AUGUST 18, 1915.

**W. D. BOST,**  
From 340 Eddy St., San Francisco, Cal.  
To Residence unknown.

**F. C. DOWNS,**  
From Craig, Colo.  
To Residence unknown.

**J. N. PATTERSON,**  
From 488 Geary St., San Francisco, Cal.  
To Residence unknown.

**F. G. SCHACHLEITER,**  
From 717 Central Ave., Hot Springs, Ark.  
To Residence unknown.

**C. J. KOERBER,**  
From Byberry Road, Torresdale, Pa.  
To Care Gerhard's Pharmacy, Tacony, Philadelphia, Pa.

**CARL STIER,**  
From Care Gulf Quarantine Station, Biloxi, Miss.  
To U. S. Quarantine Station, Boston, Mass.

**W. E. FENDER,**  
From Ft. Adams, R. I.  
To Residence unknown.

**ERNEST N. DYER,**  
From Residence unknown.  
To 981a Tremont St., Boston, Mass.,  
(former address).

**JOHN VARGA,**  
From 2017 W. 25th St., Cleveland, Ohio.  
To 1299 2d Ave., New York, N. Y.

**WM. L. B. BRITAIN,**  
From 4408 Carter St., Norwood, Ohio.  
To 1911 Williams Ave., Norwood, Ohio.

NOW READY

Thirty-Fifth President of the American Pharmaceutical Association

J. U. LLOYD

# The Journal of the American Pharmaceutical Association

Volume IV

NOVEMBER, 1915

No. 11

Office of Publication, 63 Clinton Building, Columbus, Ohio.

Subscription, \$4.00 per annum, within the United States. To Canada, \$4.35. To other foreign countries in Postal Union, \$4.50 per annum. Single copies, 35 cents.

Entered at the Postoffice at Columbus, Ohio, as Second-Class matter.

Papers and communications for insertion in the JOURNAL should be sent to the Editor, E. G. Eberle, 63 Clinton Bldg., Columbus, Ohio. Subscriptions should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

The Association does not accept the responsibility for the opinions of contributors. Offensive personalities must be avoided.

## Thanksgiving Proclamation

President Wilson, naming Thursday, November 25, as the date, has issued the following Thanksgiving proclamation:

It has long been the honored custom of our people to turn in the fruitful autumn of the year in praise and thanksgiving to Almighty God for his many blessings and mercies to us as a Nation. The year that is now drawing to a close since we last observed our day of national thanksgiving has been, while a year of discipline because of the mighty forces of war and of changes which have disturbed the world, also a year of special blessings for us.

Another year of peace has been vouchsafed; another year in which not only to take thought of our duty to ourselves and to mankind; but also to adjust ourselves to the many responsibilities thrust upon us by a war which has involved almost the whole of Europe.

We have been able to assert our rights and the rights of mankind without breach of friendship with the great nations with whom we have had to deal, and while we have asserted rights, we have been able also to perform duties and exercise privileges of succor and helpfulness which should serve to demonstrate our desire to make the offices of friendship the means of truly disinterested and unselfish service. Our ability to serve all who could avail themselves of our services in the midst of crises has been increased by a gracious Providence by more and more abundant crops; our ample financial resources have enabled us to study the markets of the world and facilitate necessary movements of commerce which the war might have otherwise rendered impossible, and our people have come more and more to a sober realization of the part they have been called upon to play in a time when all the world is shaken by unparalleled distresses and disasters.

The extraordinary circumstances of such a time have done much to quicken our national consciousness and deepen and confirm our confidence in the principles of peace and freedom by which we have always sought to be guided. Out of darkness and perplexity have come firmer counsels of politics and clearer perception of the essential welfare of the Nation. We have prospered while other people were at war, but our prosperity has been vouchsafed us, we believe, only that we might the better perform the functions which war rendered it impossible for them to perform.

Now, therefore, I, Woodrow Wilson, President of the United States of America, do hereby designate Thursday, the twenty-fifth of November next, as a day of thanksgiving and prayer, and invite the people throughout the land to cease from their wonted occupations and in their several homes and places of worship render thanks to Almighty God.

## Scientific Section

Papers Presented at the Sixty-Third Annual Convention

### MINUTES OF THE SECOND SESSION

(Minutes of the first session in September number, pp. 1120-1120.)

The second session of the Scientific Section was held August 11, 1915, at 2 p. m. The session was called to order by Chairman Engelhardt, Dr. J. A. Koch acting as Secretary.

Upon motion, the reading of the minutes of the first session was dispensed with.

The report of the Committee on Quality of Medicinal Products was read by title and distributed in pamphlet form.

A telegram from Mr. B. L. Murray, Chairman of the Committee on Ebert Prize announcing that the Committee had awarded the Ebert Prize to Mr. E. N. Gathercoal for his paper on "The Pharmacognosy of the Medicinal Rhamnus Bark," was received and approved.

Chairman Engelhardt: The first number on the program will be a paper by Dr. A. R. L. Dohme on "the Coöperation of Science and Industry."<sup>1</sup>

#### DISCUSSION OF DR. DOHME'S PAPER.

The Author: As you see, I have some practical suggestions which seemed to my mind to be the best possible means of approaching this proposition. I do not know whether you have studied it to any extent, or whether you have participated in or followed to any extent the work of the Chamber of Commerce of the United States. But, really, it is so far ahead of any other institution of the country, and the results that it is actually producing are so far-reaching, that I feel that it should be forcefully presented to you; and I might say that during the last year it has practically molded so far as that is possible, the opinion of Congress on such things as the shipping bills, and many other problems confronting it. And as a man who is actually in touch with this work every day, I can tell you that as a result of its work and methods it is in touch today with practically every Chamber of Commerce in the United States, of every city of any size or of any manufacturing center of any size, national associations, and the leading manufacturers of cities, and governors of states; and it has had occasion to put out referenda during the past six or eight months on practically all or at least many of the large questions confronting this country, and I might say that they are really marvels in the way of compilations; are marvels of analysis, and are marvels of work, and they are accomplishing the results.

Senators at Washington and legislators, as I have often had occasion to observe, heed and pay attention to what this body says, and what its men utter and suggest; and while it is only a beginning, while the institution is a young one, its membership is growing, I might say at a stupendous rate, and I think it gives promise, in fact, I am almost sure that it will succeed in the next year, in practically taking from politics the tariff question. I am myself convinced that by its means the tariff will be eliminated hereafter as a political proposition.

They (the United States Chamber of Commerce) are getting the consensus of opinion of all our great economists, all the prominent individuals connected with chambers of commerce, and therefore connected with the Chamber of Commerce of the United States, of all

<sup>1</sup>The paper was printed in the September issue of the Journal, page 1105.

our boards of trade, of all our large manufacturers, of all associations, wholesale and retail, and that consensus of opinion and information derived therefrom, is being compiled, and when it is presented to Congress on this question there is no doubt but what it will go before Congress as representing the views of the people of the country, practically representing eighty percent of those people.

Now, in the opinion of many of the foremost men of this country, such as the great constructive bankers, large manufacturers, and many of our great statesmen, it is and does represent a most wonderful organization, in fact, has their unqualified support, and the co-operation of leading men in science and industry, as represented by the large institutions of learning, and those of the factory, and that is the next great advantage, that the following decade is going to see in this country,—the coöperation of science and industry, the thing most desired to be brought about.

And now, while really only a start has yet been made to bring that about, it seems that this organization, as one of the national bodies coöperating with the United States Chamber of Commerce, might very well suggest such a move as I propose.

I think no one can doubt, after the great experience of Germany in that line, not to mention England, France or Italy, that we need not hesitate one moment in endeavoring to bring coöperation about.

And if it is in order, I move you that a properly drawn resolution be formulated, calling the attention of the Chamber of Commerce of the United States to this suggestion, as made, of calling a conference, and that copies be sent to the Secretary or Chairman of that body.

Mr. C. W. Johnson: I feel that the universities of the West stand more ready to coöperate with manufacturing interests and other interests, and it is tending to develop these industries. We recognize that we have many undeveloped resources, particularly in the northwest section, where I hail from; the University of Washington is doing everything possible and lending every assistance at its command to adjust the needs that Dr. Dohme suggests; in fact, we have stood ready to help in any way possible every industry that will tend to help our northwest section and develop any of the resources we have there. This suggestion that Dr. Dohme offers, coöperation with the United States Chamber of Commerce in the various universities, I think is a very excellent one. I have had considerable correspondence with Mr. B. L. Murray, who is a member of the Chamber of Commerce, I think, or on a committee working in some connection with the drug industry, in which he invited our state to assist in that work; in fact, we stand ready to do so, as I have indicated to Mr. Murray, and shall do everything in our power to assist the Chamber of Commerce.

Dr. Albert Schneider: Would it not be better to have a committee to draw up these resolutions? It would make the resolutions perhaps a little more complete than if drawn up on the spur of the moment.

Dr. C. E. Caspari: Mr. Chairman, while I am heartily in favor of a motion that a committee be appointed, I believe the conditions as pictured and painted are not as bad, or rather, are not quite so bad as they have been outlined. I believe there is a growing tendency of the universities to coöperate, and the institution he mentioned—the one that turns out so many professors—I allude to the Johns-Hopkins University—is having at the present time men doing research work for chemical factories in this country. And, that is also true of Harvard and Columbia, who keep their graduate students busy in each one of these branches, working along lines which are being developed to result in practical advantage afterwards.

A Delegate: Nothing has been said of the Carnegie Institute, in the way of research; while that does not exactly mean coöperation between universities themselves, yet it does take the fresh products of the industries and turn them over to the young graduates for solution; and many of the industries which have accepted the services of the Mellen Institute, have already reaped very material monetary benefits therefrom, and it seems one of the good ways of getting at it.

The Chairman: It has been moved by Dr. Schneider and seconded by Dr. Dohme, that a committee of three be appointed to draw up resolutions, and I

therefore appoint on this committee Dr. Dohme, Dr. Schneider and Dr. Caspari. Is there any further discussion on Dr. Dohme's paper and remarks?

It was moved and seconded that the paper be referred to the Publication Committee to take the regular course, which motion was carried.

The Chairman: The next paper on the program will be a paper by Dr. R. C. Holmes, entitled "A Safety Check Valve for Laboratory Vacuum Pumps."<sup>2</sup> There is another paper which really belongs to the division on Bacteriology. I shall ask the author if he will be here later in the day, because I want to get through with the chemistry first. The paper of which he is the author, and also the papers of which the authors are present, have been read with the exception of two papers, entitled "Estimation of AtoxyI" and "Stability of Preparations Containing Yellow Phosphorus," by Mr. Winters and myself, which I expect to read now.

(Chairman Engelhardt withdrew from the chair in favor of Dr. Koch.)

These papers<sup>3</sup> after reading and discussion, were referred for publication.

The Chairman: Now we have a few papers belonging to the sub-division of Chemistry, of which the authors are not here. There is a paper on "The Estimation of Morphine in Pills and Tablets," by H. W. Jones; a paper by L. E. Sayre on "Sempervirine"; one by Dr. Dodge on "The Assay of Balsam of Peru"; one on "Color Reactions" by E. A. Ruddiman, and a paper by J. Paul Snyder on "Resin of Jalap." All of these are abstracted and can be read in this way, by title, or in full as our time will permit.

We come now to the sub-divisions of Biologic Assay and Bacteriology, and I will say that of all the papers we have, the author of one only is present. The idea of creating those sub-divisions of the Scientific Section has never been fully comprehended by your Chairman, nor could he ever see the reason why that was done. I have had the pleasure of being the first Chairman of the Scientific Section when the Section was divided into sub-divisions. To tell the truth, I had the support of but two of my associates in the attempt to solicit papers; so I tried to do it myself, and I see no earthly reason why we should have four sub-divisions. Now, in the sub-division of Chemistry we have eighteen papers; in the sub-division of Botany we have but two; in the sub-division of Biologic Assay and Bacteriology, we have eight, and in Bacteriology we have only one paper, that by Dr. Schneider. The first on the program therefore, would be the paper by Dr. Francis E. Stewart, on "Principles Underlying the Use of Vaccines, Bacterins, Antitoxins and Immune Serums, as Agents for the Prevention and Cure of Infectious Diseases."

This paper is abstracted as is also the one by Dr. R. Meinhard on "Leucocytic Extract." Dr. Schneider, will you read your paper?

Dr. Schneider: I owe you an apology. I thought I had the paper in my pocket, but find that I have left it in my office and will hand it to you tomorrow.

The paper is entitled "A Biological Test for the Presence of Arsenic, Tellurium and Selenium." The test referred to is not new. It is outlined in the last edition of Antenreith's Chemical Methods and has been in use in Europe for the last ten years. It was originally developed in Italy by Gosio and Biginelli. I am

<sup>2</sup>This paper was printed in the October issue, see page 1227.

<sup>3</sup>The papers will be printed with discussion in this or a subsequent issue.

bringing it before you at this time because I feel that many members of the American Pharmaceutical Association may not be familiar with it and also because I believe it to be a very delicate and satisfactory test which may be employed in preference to the usual tedious and time-consuming chemical tests.

The test depends upon the use of a fungus (mold) related to *Penicillium glaucum*, namely *P. brevicaulis*, which is apt to develop on bread kept in damp, dark places. The test is made as follows: The suspected food substance, chemical or medicinal agent, whether liquid or solid, is mixed with bread crumbs, placed in a suitable flask and sterilized by the usual fractional live steam method, or in an autoclave for 20 to 30 minutes, and then inoculated with the mold, and flask closed with a rubber cap to retain odor. The mold may be kept in stock culture on bread in a moist chamber.

In case *P. brevicaulis* is not at hand, any of the more common species of *Penicillium* may be used. Autenreith claims, however, that *P. brevicaulis* gives the most pronounced reaction. The sterilized and inoculated material in the rubber capped flask is incubated at 30° to 37° C. for 24 hours.

Two other substances give a similar odor reaction with *Penicillium*, namely Tellurium and Selenium. The odor reactions for Arsenic and Tellurium are similar; that with Selenium is somewhat different, more like wet mustard, but quite distinctive. The odor reaction is not interfered with by bacterial, yeast or other contamination, nor by any number or kinds of admixtures of organic and inorganic matter. Should the substances to be tested be sufficiently acid or alkaline in reaction to interfere with the development of the mold, it must first be suitably neutralized.

The Chairman: You have heard the remarks by Dr. Schneider, and now what is your pleasure?

Dr. Dohme: Did you try the percentage, Dr. Schneider?

Dr. Schneider: Well, I tried the extreme limits; in fact, the test is so exact you have limits. It does give a slight reaction in regard to plants which are supposed to contain traces of arsenic. The reaction is so slight I would not call it conclusive—one and one-thousandth—it gives off an odor lasting for several weeks.

Dr. Dohme: As delicate as the Bettendorf Method then?

Dr. Schneider: Yes, I think so.

The Chairman: In connection with the Report on the Quality of Medicinal Products, Professor Day has just informed me that Professor Rusby has left those specimens here, which are referred to in this Report.

The Chairman: We will now proceed to the sub-division of Biologic Assay and Bacteriology, and I shall call upon Dr. Fred I. Lackenbach.

Dr. Lackenbach: Touching the subjects of biological chemistry, and referring first to our Chairman's remarks regarding having four sub-divisions, and knowing that he thinks that perhaps four are too many, let me say that when the matter was first brought up, in naming these sub-divisions, it was difficult to determine the best designation for the sub-division of which I am Chairman. Biologic assay usually refers to the assay of vegetable drugs. It does not popularly refer to the assay of what are termed biologic products. Now it would seem that the subject of biological chemistry has become of sufficient importance to warrant a sub-division devoted to that branch. If we could designate this sub-division "The Sub-division on Biological Chemistry," it could embrace not only the subject of "biologics"—the preparation and dispensing of serums and vaccines—but it could embrace also such subjects as sanitation and disinfection. Immunology also is a new science closely related to these subjects. It bears upon the phe-

nomena of natural and acquired immunity to infectious and contagious diseases. The up-to-date pharmacist should be conversant with these subjects.

Now the Scientific Section partakes more or less of a technical atmosphere. The subject of chemistry, as bearing upon pharmaceutical and chemical laboratory processes; the subjects of botany, pharmacognosy and biologic assay do not bring the pharmacist in very close touch with the practical problems of his vocation. While it does in a roundabout way have this end in view, what the pharmacist most needs is that which will render him more useful to the public and of greater service to the profession of medicine. Now I do not mean that the pharmacist must necessarily adopt a servile attitude toward the physician. When I speak of service to the physician, I mean service to the public *through the physician*. The physician himself is but a servant, a high-class servant. Whenever matters come up which are sources of annoyance in dealing with the physician, I endeavor to bear this fact in mind. I was just discussing with Dr. Dohme the matter of relationship between the manufacturing pharmacist and the Council on Pharmacy and Chemistry of the American Medical Association. Now if there is necessity for coöperation anywhere in matters pharmaceutical, it is for coöperation between the pharmacist and the physician; because the pharmacist has always been the helpmate of the physician. We must work out some scheme that will make the dispensing pharmacist of still greater value to the physician. If there is any means by which this may be brought about through the work of this Section, I am heartily in favor of such a movement.

Now, my sub-division comes very close to great human necessities; that is, to the grave ills of humanity. The greatest progress in medicine during the past ten years has been in the fields of immunology and biological chemistry. The tendency of medicine today is toward *prevention* rather than cure. This hits the conventional pharmacist pretty hard. It enormously cuts down the demand for drugs. You will find in the case of typhoid fever, for example, that it may be practically eliminated through the use of the immunizing agent, typhoid vaccine. It may be eliminated through the enforcement of proper sanitary regulations.

You all know what the demand was upon the pharmacist when typhoid was prevalent; and how about diphtheria, gonorrhea, and the "blood purifiers" used in syphilis? And tuberculosis: we can easily remember when great quantities of medicines were used in the treatment of tuberculosis—preparations of creosote, guaiacol, cod liver oil and petroleum emulsions, and what not. The approved treatment of tuberculosis now is along hygienic and sanitary lines and prevention. We now deal with *the problem* of tuberculosis, and its prevention. These are but a few which come to mind. There are many other serious ailments which have passed out of the realm of therapeutics into the domain of sociology, immunology and preventive medicine. No humanitarian or broad-minded pharmacist would stem this tide if he could. Re-adaptation is his necessity and his first duty.

Now, I am especially interested in two things: First, that the sub-division on biological chemistry include the subject of immunology and the subject of sanitation as a means of bringing the Section into more intimate touch with the requirements of the pharmacist of today and the pharmacist of the future. The second thought is that we take up Dr. Dohme's slogan, "Coöperation," and start in where cooperation is most urgently needed, and that is between the pharmacist and the physician.

Now, the great problem of pharmacy today is to advance the profession of pharmacy. That is, perhaps, the main ideal of the A. Ph. A.

The great problem of pharmacy today is to advance the profession of pharmacy. We either must advance the profession by improving the mental equipment of the pharmacist, or we must relieve him of all necessity along that line, and permit him to develop along strictly commercial lines. In the latter event he must be discouraged from making any pretensions to professional attainment.

What I am getting at is this: My wife and I were down town one evening. She wanted some soap powder. We went into a big chain drug store, and after purchasing what we wanted we were offered half a dozen other things, having no bearing upon our purchase. That was all well enough. We went out of the store by a rear exit where we observed a small refrigerator marked, "Biological Department." That excited my interest. I ducked down, looked through the glass front, and saw a few scattered packages of bacterial vaccines, and some other products which I won't mention. I then lifted up the top where there was a chunk of ice, about the size of my fist, with three bottles of Mumm's Extra Dry hugging it close. The man in the prescription department was beginning to eye us suspiciously, so we withdrew.

Now, that concern is distinctively "a drug store," but because of the advertising value attached to it, they made a pretense of distributing biological products, because biological products are presumed to be high-class pharmaceuticals.

I recall reading a paper in the last number of the Journal of the American Pharmaceutical Association by a Mr. Nelson I believe, in which he advocated pharmacists taking up laboratory work as a means of advancing their professional status. I read the paper very carefully and I found that while his logic was good insofar as taking up the examination of,—we will say, inert materials,—to determine their purity, etc., but when it comes to dealing with clinical problems, that was another proposition. The matter has been discussed before this Association before,—the proposition of the pharmacist doing clinical laboratory work. Now, we have had some experience along this line. We have a department in which we undertake all manner of clinical laboratory work. We tried out every class of help that suggested itself. We have tried out graduate pharmacists; we have tried out thoroughly experienced prescription men; we have tried out nurses,—some very capable ones,—who were graduates and who had taken up laboratory work. The last one we tried out was a young man who received special training under one of our laboratory staff, and was supposed to have developed into a very good laboratory worker. But he gave it up. Clinical laboratory work involves such responsibilities the very best trained man is none too good.

We decided that the best person to do clinical laboratory work is one that has had special medical training. If the pharmacist is going to undertake clinical laboratory work, he must have a certain amount of special medical training; possibly a medical preparatory course. The two-year preparatory course that is given in our universities in California would perhaps be sufficient preparation. When it comes to determining a diagnosis of syphilis, where the happiness of a human being and those dependent upon him is at stake, the laboratory man assumes an enormous responsibility.

We have such matters brought to our attention most every day. Really they are about the most pathetic things on earth. We will receive, for example, a specimen of sputum, and we may find no tubercle bacilli in that sample. If the patient learns of the findings, he, of course, will feel gratified. But perhaps the next specimen from the same case may be chuck full of tubercle bacilli. A laboratory man who is only a laboratory man will report no T. B. to be found. If he reports direct to the patient he will convey the impression to that patient that he has nothing to fear. It is not only the laboratory technic, it is the ability to tell the *significance of the findings* that makes the laboratory worker of real value.

My paper to be read before this Section dwells upon that point, and I would say that it is only a fragmentary presentation of a great subject,—this subject of clinical diagnosis. Yet, with all the responsibility that I lay stress upon, I believe that the future of the pharmacist is along these very lines,—to be able to assist the physician in his diagnosis.

It is a very important subject. The physician endeavors to educate a nurse, perhaps, to handle that work for him, or he sends it to a commercial laboratory.

or he takes a medical student as assistant. But these are all makeshifts. The nurse as a laboratory worker is only occasionally a success. The medical student is working with a view to taking up the practice of medicine, and the commercial laboratory, as a rule, is not interested in the patient. The pharmacist, on the other hand, is usually a man of good judgment; has received special training along kindred lines; is a man of integrity, and broad sympathies, and a responsible person in the community. If the pharmacist can be educated to do that work for the physician, it will certainly elevate his professional status very materially.

There were some other things I had in mind, but I am sure I have already imposed upon your indulgence too greatly.

The Chairman: You have heard the address of Dr. Lackenbach, and it is now open for discussion.

#### ABSTRACT OF DISCUSSION.

Mr. Hamner: It is very presumptuous on my part to address you, but I do claim that the pharmacist is better equipped by education from every point of view than the average practitioner of medicine. Practically all laboratory work deals to a large extent with reagents, either chemical or biological. A practicing pharmacist, working at his profession constantly, must be familiar with these reagents, while a practicing physician doing such work rarely, is not, and for that reason I rather take exception to his assertion that a man should have medical training rather than pharmaceutical training in addition to biological work.

Dr. Schneider: Would you be willing to say that the medical profession, as such, welcomed the entry on the part of the pharmacist into laboratory work with a view to doing such work?

Dr. Lackenbach: I think so.

Dr. Schneider: I think the medical profession is inclined not to do so, but I may be mistaken there.

Mr. Hamner: In our line, in the Army, we depend very largely upon biological research in our laboratory work, upon our biologists in the Army, and I find from talking to the surgeons, that they are very glad and anxious to have men trained along that line of work, men to whom I can turn over that work to do. As I said before, in their general practice, physicians themselves do not do enough of such work to keep them perfectly familiar with the necessary detail of laboratory work.

Dr. Zieg: I think pharmacists should consider that an important thing, and I quite agree with the last speaker, that from the standpoint of the actual doing of the work, that the pharmacist should have more desire to do it. But there is really another important step between the actual doing of the thing, the thing to be examined, and the interpretation of the result, which is quite important; that is, to see that the obtaining of the thing to be examined, the specimen to be obtained, the actual care of it up to the time it is to be manipulated, and then the actual care in regard to the avoidance of deterioration while it is being manipulated. These are things which the pharmacist, because he has more or less turned his face away from the subject, does not have a full appreciation of.

I think because of the great necessity, and the coming greater necessity, both in actual therapeutic use and in actual sanitary and preventative medicine, that it is certainly one of the biggest fields that the pharmacist could step into if he acquires the proper ability, and I therefore urge that requirement in such a way that those who depend upon him—that is, the medical profession—can rely upon his ability. So far I agree with both speakers.

Dr. V. I. Schmidt: My observation has been that many physicians who have a large practice do not. I know a number who have a large practice in this city who employ a bacteriologist, a man properly trained to do the kind of work. They have him make these examinations for the finding of tuberculosis, for the examination of sputum in tuberculosis or diphtheria, or any of those branches, and the physician himself does not do it. In the first place, he has not the time. I am speaking of those who have a large practice, and there are a great many here. They will have their men. And they have a special laboratory, a little laboratory set aside in their offices, and when the physician gets a case that needs

examination he hands it over to his man, and he generally has confidence in him and he acts upon it. Now we cannot expect, at least the public cannot expect a busy physician to make those examinations himself. He must have men to do that sort of work who are well trained and upon whom he can rely, and I believe that is being done, as a general rule.

Dr. Dohme: Mr. Chairman, I would like to set forth the experience of physicians in our city in work of this kind. I believe it is a work growing in importance and extent. I speak of clinical diagnosis. I believe the medical profession has done by far too little heretofore and I believe they are beginning to realize the fact that they have not done enough of it, and in consequence they are doing a great deal more of it now than ever before. And in Baltimore, they are developing certain physicians who are making a specialty of this clinical diagnosis, by equipping themselves with laboratory apparatus and a laboratory which will enable them to practically answer all the requirements of a practicing physician or surgeon, in a most thorough and scientific way. But, as I say, these men who are developing in our city at any rate, are in all cases, or at least in the principal number of instances I know of, physicians who, instead of doing practical work—practicing medicine—are practically making a specialty of clinical diagnosis, and making a very good living at it.

I know one intimate friend of mine who was the originator or beginner of that work, and he makes as much on his work as many of our leading surgeons do, as a source of income. With his equipment and his knowledge, as pointed out by the previous speaker, he is, in addition to being able to say what the sputum contains, or what that blood stain indicates, or this or that secretion contains, able to give the physician some practical idea of what he thinks are the conditions that produced it, or how he can remedy it. And, if this is true, it looks to me as if the added medical attention might serve some added purpose, not merely finding out what is in that particular secretion, because, as the gentleman says, there are many of our physicians who have not the time and who perhaps haven't the ability to go into the intricacies that such an examination would require in order to make a diagnosis and to form a correct conclusion. An expert with this training in clinical diagnosis could give such information to the physician as would probably be the means of indicating treatment or suggestive cause. I am only mentioning that as an experience.

There is, however, one of our retail pharmacists,—by the way, he is here today, Mr. Hynson,—who is also developing a very large practice in that line and whose specialty is, more perhaps than other retail pharmacists, catering not only to the wants of the physicians, not only looking after their prescriptions, but also, so far as his equipment goes, of aiding them in this way, proffering such assistance to them, either at the home or at the office.

And his firm is developing a line of clinical diagnosis which promises to be of quite some value to them. And as I recall it, the man in charge of that work is a pharmacist in this case, but I do not think from my own personal knowledge, it may not be very thorough,—that the results which you would obtain there, or the doctor would obtain there, would be as satisfactory to the doctor as the results he would obtain from the physician diagnostician.

Dr. Lackenbach: I do not think I made notes of all the speakers in the discussion, but to take up Dr. Dohme first, I would say that the physician who specializes in laboratory work is usually the physician who has not been successful in building up a general practice or taking up any special field of endeavor, or he may have a liking for laboratory work. Now, it is hardly possible that he would have a liking for laboratory work, as such, because it is mostly drudgery, very hard work, and it is not profitable work unless he can get a great deal of it to do so that he can employ assistants to do the rough work and run through a number of tests at the same time, as in the case of the Wassermann tests. Another thing is that physicians are not always inclined to send their patients to these laboratories. They fear it might have undue influence on the patient in some way.

Taking up the first speaker: The pharmacists in the Army and Navy are usually pretty well equipped to do clinical laboratory work. In fact, they are the only class of pharmacists who have had such training. I know of some men who have been trained in the Army who have established very prosperous commercial laboratories.

Their time, as a rule, is not so valuable as the time of a medical man,—the man who has had a medical training,—they are able to do the work cheaper, and in that way are aggressive competitors to the medical laboratory specialists.

Mr. Schmidt is perfectly right, that men who have large practices have clinical laboratory workers who do most of their work. Usually a group of medical men will have a clinical laboratory worker, but that is largely confined to a few groups of physicians. The ordinary run of medical men cannot afford such a luxury.

A matter that Dr. Zieg brought up is of very great importance, that the medical men do not often understand how to gather the material for the laboratory worker. The material that comes into the clinical laboratory is an outrage many times. It shows the physician hasn't the remotest conception of what is embraced in the laboratory test. Of course, if the pharmacist were to undertake that work, it is pre-supposed that the pharmacist would be in a position to instruct the physician along these lines. Was there any further point, Dr. Zieg?

Dr. Zieg: Merely touching the point that the physicians are really willing to have the work done by the pharmacists.

Dr. Lackenbach: That is a very important point, and that is where the shoe pinches. The physician doesn't want the *druggist* to do his work. I wouldn't want the average druggist to do my work. But the physician does want a high-class man to do his work, and he receives such a man with open arms. He does not want an incompetent druggist to determine whether or not his patient has syphilis, but he would receive a high-class man, and I do not mean necessarily that a man in order to be a high-class man, must have a number of college degrees. My idea about pharmaceutical education, I am sure, differs very materially from that of the college professor. Our President brought up that subject in his annual address. He commended a system of education permitting elective courses to be followed, not only in the university, but in the high school and grammar school as well. Now my idea is that the ordinary student, after he graduates from grammar school, should select the studies for which he has a natural bent. He should not be put through a set course of studies, with a view to putting him through the university. It is really pathetic, the young people we get from the high schools, and even the people we get out of the college. They are helpless. They cannot do practical things. They have to live more or less in exile for two or three or four years until they find themselves—until they find what they are actually fitted for. I think this idea of putting a student through a regular course of study, graduating him from the grammar school, and then the high school, and then sending him to college is a false idea of education. It makes of the college graduate many times if he is weak, a snob, to use a slang expression. He is a conceited being, with a conceited notion that he is a superior being. Another thing, he uses the college as a means of advancing himself; proclaiming that he is a college graduate, he endeavors to obtain a standing that he is not entitled to by virtue of his own abilities—his own actual worth.

The pharmacy student can take up special studies—certain courses in the pharmaceutical college that he likes, as, for instance, pharmaceutical chemistry. He might take certain lecture courses and certain laboratory courses. Then he can take certain courses in the medical college that will render him capable. He does not necessarily have to work for the college degree.

The Chairman: It is moved that Dr. Lackenbach's address take the regular course of being referred to the Publication Committee.

Dr. Dohme: Mr. Chairman, I would like to move in connection with that, or rather amend that motion, by suggesting that at our next meeting the topic of clinical diagnosis from the standpoint of the pharmacist be considered as one of the subjects to be discussed at the Scientific Section.

The Chairman: You have heard the amendment by Dr. Dohme, that the topic of clinical diagnosis may be made the subject of a paper or papers at the next meeting of the Association. What is your pleasure?

(It having been regularly moved and duly seconded, and the question having been called for, the motion was declared carried, and it was so ordered.)

The Chairman: That covers the address of Dr. Lackenbach, and also his paper, which was read and referred.

We have a paper by Mr. H. A. B. Dunning, on "Remarks on Phenol-Sulphone-Phthalein," and one by Professor E. L. Newcomb\* and Mr. R. A. Hall, on "Comparative Physiological Activities of Digitalis Species."

Dr. J. A. Koch: We have a resolution from the committee appointed a short time ago:—

*"Resolved, That the Scientific Section of the A. Ph. A., request the Chamber of Commerce of the United States of America to call a conference of representatives of universities and educational institutions of this country, and of our leading industries, for the purpose of developing some practical method of bringing about the coöperation of science and industry with a view to perfecting and advancing the industries of our country."*

The Chairman: A motion is in order.

(It was then regularly moved and duly seconded that the resolution be adopted; motion carried.)

RESOLUTION PROVIDING FOR COÖPERATION WITH THE INDUSTRIES.

WHEREAS, It is generally admitted that commercial progress in Germany in the past two decades has been the result of a hearty and complete co-operation between the scientific and industrial organizations of that country; and

WHEREAS, All the financiers and business men will concede the application of the science of the university to the practice of the factory will produce similar results in this country; and

WHEREAS, It is our opinion that the next great stride in our commercial growth will be in the direction of applying our scientific training represented by the university to practical use in our industries; and

WHEREAS, The factory and the university have stood aloof from one another to the disadvantage of both these many years; therefore be it

*Resolved, By the Scientific Section of the American Pharmaceutical Association, that the United States Chamber of Commerce be requested to call a special meeting of representatives of the leading institutions of learning and of leading large manufacturing interests of the country, together with representatives of the leading banking interests of the country, for the purpose of considering ways and means of generating and fostering a spirit of closer coöperation between them than has heretofore existed or now exists*

Professor Edwin L. Newcomb: The paper I have prepared is chiefly on results, and I will not take the time of the members of the Section, to read all of the results, but simply name the methods which were employed and a few of the data concerning the drugs on which they were made.

"Comparative Physiological Activities of Digitalis Species"\* is the title. I wish to say that the work has been done jointly by Dr. R. A. Hall, of the Medical School of the University of Minnesota and myself.

There were some thirty or forty animals used. Table "A" includes all the results, and Table "B" is a summary I have prepared.

It might be said in connection with the work on guinea pigs, that the work was quite satisfactory, so far as the investigators were concerned; that is, in only one case was there any great amount of discord.

The Chairman: We have papers also by Mr. L. E. Sayre, C. W. Ballard, C. S. Chase, and others. It is twenty minutes past four, and it might be well, since the authors are not here, that we read some of the papers in abstract as mentioned by Dr. Dohme before.

Dr. Turner: I do not think it is necessary. It seems to me that inasmuch as some of these authors are not here—and the authors should be here to reply

\*The paper is to be presented later by the authors and was referred for publication.

to questions and objections which might be raised—that we had better stick to our old motion to read them all by title, and I will make that motion.

The Chairman: It was brought up by Dr. Dohme at the beginning of the meeting, and a motion was made and amended that the old custom be followed, if time permitted—that is, that the abstracts of the papers be read,—and it was accepted. I am willing to dispense with the abstracts, but to read all of them would take but twenty minutes or so. If our Secretary feels so inclined, they will be read. And it was so ordered, and the papers were read in abstract.

The Chairman: I beg to say that I have three papers, one by Mr. Twining, one of the papers covering a well-known assay method and another a well-known diagnostic process, and also a paper on "Approved Methods of Biological Standardization of Drugs," by Dr. C. S. Chase. Also a paper on "Color Reactions," by E. A. Ruddiman. I did not find it necessary to abstract it, as it is a short paper, and might be read in short, since it is against our rules to do otherwise. Dr. Ruddiman dwells on the fact that it is very difficult to distinguish one alkaloid from another, by the specific reactions, because the alkaloid might contain some kind of an impurity which makes the color reaction rather indistinct. He again points out that it is absolutely necessary that the various alkaloidal preparations should be prepared in a certain way.

This is all, with the exception of three which have not been abstracted. You are well acquainted with the diagnostic tests for kidney diseases, and if you so desire I shall be very glad to abstract the one by Mr. Dunning on Urease.

You all know that Urease is an enzyme which has the property of converting urea into ammonium-carbonate. It also determines the urea in the urine. I think we can refer this paper without abstracting it.

Gentlemen this will wind up all the papers we have, so the session tomorrow will, consequently, be only a very short one. We will have to select officers tomorrow morning and install those that might be present.

A motion to adjourn was carried.

#### MINUTES OF THE THIRD SESSION OF THE SCIENTIFIC SECTION.

The third session of the Scientific Section was held on Thursday, August 12th, at 9:30 A. M. Chairman Engelhardt presided. The first order of business was the election of officers, which resulted as follows:

Chairman, Mr. W. L. Scoville.

First Vice Chairman, Mr. L. A. Brown.

Second Vice Chairman, Mr. Joseph L. Turner.

Secretary, Mr. E. L. Newcomb.

Upon motion, a vote of thanks was given the retiring Chairman.

The Section then adjourned.

APPROVED METHODS OF PHYSIOLOGIC STANDARDIZATION OF  
DRUGS.\*  
HISTORICAL SKETCH.

CHARLES S. CHASE, M. D.

The general subject of standardization of drugs, from the chemical standpoint, is too well known to this body of scientific men to require more than the mere statement. The author of this paper does so, chiefly for the purpose of correlating it with the subject of this paper.

That there was once a need of standards, at the time of the beginning of the publication of the Pharmacopœia, almost a century ago, also goes without saying. To be historically exact, it may be stated that the Pharmacopœia was born in 1817, and that Dr. Lyman Spaulding was its historical father. The narrative touching its infancy and early days and growth, as found in the early part of its introduction, must always prove very interesting reading to the members of your profession.

The thought at the date mentioned, no doubt, was that polypharmacy had held sway long enough. Times even at that long-ago date had advanced sufficiently so as to exact more scientific and less slipshod methods: more science and less empiricism. Once started, the work of improvement and perfection grew apace, each succeeding decennium adding its moiety of art and of science toward the attainment of a better and still better "book of standards."

At the outset the medical profession appears to have been much in evidence in its development and promulgation. Later and even at the present day your profession has led the way with acceptance and profit. Both professions, however, it is pleasant to remark, have shown during the last two decennial periods a better spirit toward each other, a spirit of "getting together" in this important work. As a result a composite work is clearly developing, made up of contributions from every available source.

In the foregoing brief historical sketch of the Pharmacopœia it is interesting to note that not until the Revision of 1890, the seventh in order, did there appear specific direction as to establishment of "standards of purity." So interesting and so important as well does this point seem to your essayist that he craves your indulgence of a somewhat lengthy quotation from the introduction of the Revision mentioned. As touching this point it declared as follows, "It was recommended by the Convention that assay processes should be appended to the United States Pharmacopœia, descriptive of the "energetic," or "otherwise important" drugs, and to such galenical preparations as the Committee of Revision of the Pharmacopœia should deem wise, especial care being taken that assay processes for *Opium* and *Cinchona* should be attended with as little manipulative difficulty as possible; that the standards of purity of drugs should not be above the point of practicability, etc." The deductions your essayist makes from these statements, which seem to him to be important, are two-fold, namely, first, that a beginning to set "standards of purity" should have been made at so recent

\*Presented at Scientific Section, A. Ph. A., San Francisco meeting.

a date; and, secondly, that a few years later (1900) the second step, "physiological standardization," should have been suggested; "suggested" only, to be sure, without recommendation to make use of such process. It is with much satisfaction, however, may it be hoped we all agree, that the last Revisional Convention, that of 1910, created a large Committee with full power to act, touching this among other matters. At the date of preparing this paper your essayist understands the Revisional Committee will make processes of pharmacologic assaying optional with the pharmacist in the forthcoming revision.

#### PRACTICABILITY OF PHARMACOLOGIC ASSAYING.

That galenicals are more likely to be efficient when standardized by any ac-

cepted process is practically axiomatic. Indeed nearly all crude drugs of importance, whose active principles can be isolated and estimated without destruction by chemical assaying, are required by the present Pharmacopœia to be so treated. A few, however, notably those containing glycosides, which are of the greatest importance in practice, can not be so treated. Digitalis, strophanthus, squill, and almost all of the so called, "digitalis bodies," are of this class. Ergot may likewise be included in this classification, for it is also practically non-assayable by chemical processes. Under former pharmacopœial direction it was evidently assumed the crude drugs must have been, perforce pure, whatever that term may have meant, and "void of offense" (intentional at least). Under the "New Plan," as it might well be called, the drug, with its galenical preparations, is to be challenged at every step in its journey toward "certainty of actions," as

shown by its assay. Could more be desired? Should less be accepted, where the issues are, life or death?

Pharmacy, as an art has all along kept even pace with its sister arts; but, as a science has it or has it not lagged sadly behind? Who, though, can challenge its splendid modes of encapsulating disagreeable and nauseating drugs? Who does not welcome the ampoule and the spiret as sure means of preventing deterioration of active principles? Who can fail to commend the skillful methods of preparing for use vaccines and sera, so skillful, indeed, as to make infection in their use almost impossible? Much more could be said, much more deserves to be said in praise of your profession along these lines.

But to be more specific in this discussion is it asked, "how" and "to what

extent" may pharmacology be an aid to the pharmacist? Let the reply be, first, as to "how it may be." It can be a help in almost every way, and a hindrance in none. Does one question whether, for instance, digitalis, or any member of its group of drugs, or ergot also, if standardized physiologically, the only way most of them can be standardized at all, the result in their use would not meet with instant approval? Surely those who prescribe and those who must use these drugs would do so. The uncertainty as to the strength of supposed active principles in these drugs, affecting so vital a process as circulation and its control, has been too long a reproach upon the professions of medicine and pharmacy. This reproach, fortunately, has been very largely removed by the large and scientific manufacturing houses of our own and other countries, to their great credit may it not be declared.

Secondly, "Is the process feasible or practicable?" it may be asked.. This query might be considered as practically a corollary to the two immediately preceding propositions. To whom, "feasible?" For whom "practicable?" To the pharmacist, wholesale and retail, in reply to the first. For the physician and his patient, in reply to the second inquiry. Is the "process" one to be easily learned by the former class? Can it be acquired by one long out of school and in business? Are "short courses" possible in schools, if one desires to avail himself of such means of information? Has the subject been taught in schools of pharmacy, and, if so, with what degree of helpfulness? These and many other questions suggest themselves at once to the progressive mind, and deserve careful and thoughtful answer. The wholesale manufacturing houses already alluded to are daily answering some of these questions with great acceptance. An attempt will be made to answer them as applied to the retailer, especially those who manufacture their own galenicals from crude drugs, later. As to the "teachableness" of the subject to undergraduate students, or graduate students as well, the best reply is to submit a concrete case in which it has been done.

The essayist as long ago as 1905 was impressed with the thought that the pharmacist more than the physician should be trained in pharmacology. He introduced it, therefore, in his course in materia medica in the College of Pharmacy of the University of Iowa. He provided, however, for an antecedent course in physiology, covering about the same ground as is suggested by the Pharmaceutical Syllabus. With this course as his foundation the student was led through a purely didactic course in materia medica, the action of drugs being strongly emphasized. Following this a purely laboratory course was given, illustrating by means of animal experimentation all the points made in the didactic course. Especial attention was directed to the glucoside-containing drugs. An opportunity was also made use of in illustrating toxicology, by means of pushing drugs beyond their therapeutic limit and requiring the application of suitable antidotes in each case.

No more interested or enthusiastic classes were found than those whom the essayist was required to teach in the institution named. These consisted of students in the medical and dental colleges therein. The courses differed in the three colleges in no essential detail, only in the amount of work required. The "evidence from the field," also during the years that have passed since the work began has been uniformly supportive and in justification of it. Many of our graduates have pronounced it helpful to them beyond their belief when taking it. Some of them, indeed, have equipped their laboratories quite elaborately with expensive apparatus with which to carry on this mode of assaying as well as the modes they have for so long a time been accustomed to.

#### PRACTICABILITY FOR THE RETAIL PHARMACIST.

Probably no statement made in the present paper will be more quickly challenged by the retail pharmacist, especially by those who have had no opportunity to observe the practical working in a laboratory, than this particular division of the subject. Is it really possible for one not thus trained to undertake to familiarize himself with it? The essayist considers it easily possible. He believes, further, that no class of pharmacists will more enjoy the actual laboratory

work than these. The processes are no more difficult and much less intricate than many of those laid down for chemical assaying.

At the risk of being prolix I cannot refrain from presenting somewhat in detail at this point methods used by my own students in their laboratory work. Among many excellent processes for standardizing drugs the essayist selected that of Famulener and Lyons, known among pharmacologists as the "One Hour Method." It consists, briefly, first, in carefully selecting the frogs required by the method. They should average in weight from 20 to 30 grammes. They should be kept in a cool place, in ice during the summer months. When possible they should be procured as fresh as may be, from near-by brooks, or from swampy fields. When needed for experimental purposes they should, first of all be pithed in the brain, thus rendering it insensible to pain, as well as immobilizing the animal; next exposing its heart by cutting away a small diamond-shaped portion of the skin over the same. Thus prepared, with the animal lying upon its back, a pin bent to resemble a fish-hook is passed through the apex of the heart and connected by means of a thread to the short arm of a straw lever. (The method of constructing this piece of apparatus, as well as a more elaborate and expensive one will be shown with this article.) Thus exposed and attached the test as to efficiency of drugs of the cardiant type is easily made. The drug to be tested, usually a fluidextract with its solvent driven off by heat over a water-bath and water in sufficient quantity added to bring it up to its original volume, is allowed to drop continuously upon the exposed heart until its pulsations are observed to cease. The dose which accomplishes this is known as the L. F. D. (Least Fatal Dose). It is customary to prepare several frogs of about the same strength and weight, and as many doses of the tested drug. Thus a frog and its dose of the drug will be found in which the pulsations will cease in *exactly one hour*. This dose should be considered the L. F. D. sought and should be carefully noted. Corroborative tests should be made and averages struck, as in volumetric chemical analyses. From the findings thus obtained the dose suitable for the human patient is easily computed.

A second illustration of testing a drug physiologically is found in ergot. This drug is known to possess, if potent, strong vaso-constrictor action. So powerful is this action that an animal like a cockerel is usually selected for testing purposes. The white leghorn is best, because of its prominent comb and wattles, both of which are highly vascular. The preparation of the drug usually selected is its fluidextract, and the mode of its application is by hypodermatic injection into the muscles of the breast. If the drug is potent a very marked discoloration will appear within an hour or so, shading from a simple bluish to a bluish-black color. The duration of the discoloration will depend, usually, upon the strength of the specimen tested. The normal color will return ordinarily in a short time, and the animal can be used again. This method is the one used and recommended by the Bureau of Public Health at Washington, D. C., and is submitted, therefore, as the one to be preferred in practical testing for this particular drug.

It will be observed in Fig. 1 that the apparatus may be very simple and inexpensive. In Fig II it is more complicated and expensive.

## COLOR STANDARDS AND CUDBEAR.\*

H. V. ARNY AND C. H. KING.

In 1908 the Committee of Revision of the National Formulary appointed a sub-committee of which one of the writers was chairman, to devise a means of standardization of the color of tincture of cudbear and tincture of caramel made by the methods proposed for the next issue of the Formulary. The difficulties of establishing such standards were explained in detail in a paper that appeared in the *American Druggist* (60-1912-35); the finding of standard color fluids was announced at the Eighth International Congress of Applied Chemistry (Jour. A. Ph. A., 2-1913-76), while the elaboration of the work to practical completion is the subject of a paper appearing in the *Journal of the Franklin Institute* for August, 1915. At this time we will merely demonstrate the standard fluids and will announce that the most difficult problem of all, the matching of cudbear tinctures, has been accomplished.

The result of the work first outlined was the devising of three sets of standard colored fluids, which we have designated as the "Co-Fe-Cu" the "Co-Cro-Cu" and the "Cro-Manganate" blends.

The "Co-Fe-Cu" tints have as their basis: *Red Acidulated Half-Normal Cobalt Solution* containing 59.49 gm. of cobalt chloride,  $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$  to the liter, the solvent being one percent hydrochloric acid; *Yellow Acidulated Half-Normal Ferric Solution*, containing 45.05 gm. of ferric chloride,  $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$  to the liter, the solvent being one percent hydrochloric acid; *Blue Acidulated Half-Normal Copper Solution*, containing 62.43 gm. copper sulphate,  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  to the liter, the solvent being one percent hydrochloric acid.

The "Co-Cro-Cu" tints are prepared from ammoniacal solutions of the three elements mentioned, the solvent in each case being 2.8 percent ammonia water. These consist of *Red Ammoniacal Fiftieth-Normal Cobalt Solution*, containing 2.7 gm. of roseo-cobaltic chloride,  $\text{CoCl}_2 \cdot 5\text{NH}_3 \cdot \text{H}_2\text{O}$  to the liter; *Yellow Ammoniacal Fiftieth-Normal Chromium Solution*, containing 0.420 gm. of ammonium dichromate,  $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$  to the liter; and *Blue Ammoniacal Fiftieth-Normal Copper Solution* containing the equivalent of 2.49 gm. copper sulphate to the liter.

Details concerning the preparation of these "Co-Cro-Cu" fluids and their blends will be found in the *Journal of the Franklin Institute* for August, 1915.

The blending of the acidulated fluids to make the "Co-Fe-Cu" tints, and of the ammoniacal fluids to make the "Co-Cro-Cu" hues can, of course, be performed in any proportion that fancy suggests. The 91 samples of each series exhibited include the possible blends produced in making 12 cc. of finished fluid when the ingredients are mixed in even (non-fractional) cubic centimeter quantities. The nomenclature devised is of the simplest kind. Thus the original red fluid is "R. Y. B. 12-0-0" the original yellow is "R. Y. B. 0-12-0" and the original blue is "R. Y. B. 0-0-12." The sample designated as "R. Y. B. 6-6-0" will of

\* Presented in Scientific Section A. Ph. A., San Francisco meeting.

course be an orange hue, that called "R. Y. B. 0-6-6" will be green, while "R. Y. B. 6-0-6" has a purplish hue.

That the intensity of color of each of the three basic fluids is about the same as shown by the fact that "R. Y. B. 4-4-4" closely approached, both in the "Co-Fe-Cu" and in the "Co-Cro-Cu" series, the "neutral gray" which is the nearest that blended reds, yellows and blues can approach to pure white in solids or transparent colorlessness in fluids.

As to the permanency of these fluids: the original acidulated cobalt, iron and copper solutions and their blends neither fade nor precipitate to a perceptible degree until at least two years old: the ammoniacal cobalt and chromium solutions have now been under observation for over a year without any fading being detected. The ammoniacal copper on the other hand precipitates and consequently undergoes color change after a few weeks, but our experiments so far show that the blends keep satisfactorily when sealed in ampuls. Moreover the ammoniacal copper solution is in practice prepared extemporaneously by diluting the permanent half-normal acidulated copper solution to fiftieth-normal strength by addition of ammonia water and water, hence the preparation of the "Co-Cro-Cu" blends is merely a matter of mixing solutions that can be kept in stock for months without deterioration.

Having prepared a line of color fluids, the next move was their application as standards. As announced in the paper read before the Eighth International Congress of Applied Chemistry it was found that a standard *Caramel* solution prepared by heating 1 gramme of sugar to 180° C and then diluting with water to 500 cc. matched the "Co-Fe-Cu" blend, R. Y. B. 4-7-1. During the past year, we have found that in a properly conducted *Nessler Test*, an ammonia dilution representing a nitrogen content of 1 to 500,000 matched the "Co-Fe-Cu" blend 3-9-0, when this half-normal mixture was diluted to "50%" of its original strength by addition of an equal volume of water: that the color of the *Phenol-Sulphonic Acid Test for Nitrates* when the nitrogen content was 1 in 500,000 was matched by "Co-Fe-Cu" blend 0-12-0 when this was diluted to "66%" strength: that the *Molybdate Assay for Phosphoric Acid*, 1 in 20,000 gave a yellow color exactly matched by "Co-Cro-Cu" 0-12-0 diluted to "15%" strength: that *Folin's Vanillin Test* when the vanillin content was 1 in 100,000 gave a color matched by "Co-Cro-Cu" blend 3-3-10: that *Riegler's Uric Acid Test* of a uric acid content of 1 in 40,000 had the same tint as "Co-Cro-Cu" blend 2-2-8: and that a salicylic acid dilution of 1 in 50,000 when treated with the proper amount of ferric chloride solution produced a color exactly matching "Co-Cro-Cu" blend 7-1-5, that had been diluted to 65% strength.

In carrying out these colorimetric tests, exactitude of manipulation is essential and the procedure to be followed will be found in detail in a paper which will be published in the near future.

As mentioned above, the two sets of colored fluids "Co-Fe-Cu" and "Co-Cro-Cu" fail when it comes to certain shades of red. Thus the color produced in the *Naphthylamine-Sulphanilic Acid Test for Nitrites* had no match in the pink fluids of the two sets of standard blends. This led to the study of other possible standard fluids that would supply the hues not attained by the two sets of blends just mentioned and these were found in two solutions kept in every well equipped

analytical laboratory, the volumetric solutions of potassium dichromate and potassium permanganate.

An investigation of these fluids showed that a one-thousandth-normal permanganate volumetric solution containing 0.0313 grammes of  $\text{KMnO}_4$  to the liter has about the same intensity of color as a one-hundredth-normal dichromate solution containing 0.487 grammes of  $\text{K}_2\text{Cr}_2\text{O}_7$  to the liter and blends of these two fluids we have designated as the "Cro-Manganate" tints. As might be expected these blends are extremely unstable and must be used for matching within one or two hours after mixing.

Comparing blends of these with the nitrite test mentioned above, we found that the hue produced by a nitrite dilution representing 1 part of nitrogen in 10 million was matched by the standard "Cro-Manganate" blend, 15-1, diluted to 55%.

There still remained unsolved, a part of the original quest, which had started this line of color investigation: a search for standardized matches for caramel and for cudbear. The match for caramel is given above: but the curious reddish blue tint of cudbear had no match in the "Co-Fe-Cu" or the "Co-Cro-Cu" or even in the "Cro-Manganate" blends. The match has however been found and we take pleasure in reporting the news to the Association by whom the color standard work was entrusted to us.

The first step in the work of matching cudbear is to produce a standard cudbear solution of known strength representing a constant color value with any other cudbear solution of the same strength. The difficulty of this task lies in the fact that the official methods of preparing cudbear extracts and tinctures are extremely unsatisfactory, in that they do not produce anything like constant color results.

The only methods of preparation by which we were able to secure satisfactory results in constant color values, were the ones explained in detail by one of us in the *Journal of the American Pharmaceutical Association* for 1913, page 47. These are the *Alcohol-Chloroform-Acetone* and the *Chloroform-Acetone* extracts, both of which produce color values, when made into tinctures and diluted in exactly the same manner and quantity, which are fairly uniform in tinctorial power.

We had on hand some extract of cudbear, made by this method over two years ago. To 0.2 grammes of this was added 0.4 cubic centimeters of 10% ammonia water. Alcohol was then added to make a total volume of 200 cc. This tincture represented 1 part of the extract in 1000. Part of this was then diluted with water to a volume in which cudbear extract content was 1 part in 50,000. The result was a perfectly clear reddish violet liquid.

The Lovibond reading of this in a half-inch cell was as follows:

<i>Red</i>	<i>Yellow</i>	<i>Blue</i>
5.0 ± 4.0 ± 0.4	2.2	+ 2.0

We also prepared a dilution of cudbear representing 1 part in 50,000 from an old tincture prepared over two years ago from the *alcohol-chloroform-acetone* extract mentioned above. This liquid had been in a cork stoppered bottle during all that time; and while the dilution of this was not the same shade as the dilu-

tion of the freshly prepared tincture, still the liquid was perfectly clear. We made a Lovibond reading of it as follows:

<i>Red</i>	<i>Yellow</i>	<i>Blue</i>
5.0+1.8	-0.7	1.0+0.2

We now added one drop of 10% ammonia to this dilution and the color immediately changed to the standard reddish violet tint which was produced in the dilution from the fresh tincture. Note the difference in the Lovibond reading which we now give:

<i>Red</i>	<i>Yellow</i>	<i>Blue</i>
5.0+4.0+1.5	-2.5	+1.6

It will be seen that the total net color value after adding the ammonia closely approximates that of the fresh dilution of the same strength. It is not surprising that the color of this old tincture faded slightly during its two years standing in a cork stoppered bottle: but it was very gratifying to see that the original color returned on the addition of a small quantity of ammonia.

A standard color match was found for several of these cudbear samples: but we considered it advisable at this time to match only the dilution of what we consider our best cudbear tincture, where the cudbear content was 1 part of extract in 50,000.

We found that no blend could be obtained from either the "Co-Fe-Cu" or the "Co-Cro-Cu" lines of colored fluids that would properly match the cudbear hue. Even the permanganate-dichromate combination was of no avail in this case: but we found that by blending the potassium permanganate solution with our copper solution, we could get the desired result.

We finally found a practically perfect match by blending 10 volumes of N/400 potassium permanganate with 4 volumes of the half-normal acidulated copper sulphate solution. We found the Lovibond reading of this blend was as follows:

N/400 Mn	N/2 Cu	<i>Red</i>	<i>Yellow</i>	<i>Blue</i>
10	4	5.0+4.0	-1.9	0.7+0.2

We will give Lovibond readings of a few of the other blends which were examined, from which we selected the best match for the cudbear tint.

Lovibond readings all in  $\frac{1}{2}$  inch cells.

N/400 Mn	N/2 Cu	<i>Red</i>	<i>Yellow</i>	<i>Blue</i>
10	3	5.0+4.0	-1.8	+0.7
10	4	5.0+4.0	-1.9	0.7+0.2
10	5	5.0+3.0+0.2	-2.2	1.0
10	6	5.0+3.0	-2.0	1.3
N/300 Mn	N/2 Cu			
10	2	5.0+4.0+3.0+2.0+0.2	-3.5	none
10	3	5.0+4.0+2.0+0.7	-3.1	+0.4
10	4	5.0+4.0+1.6	-2.5	0.7+0.1

It must be borne in mind that while the "Co-Fe-Cu" tints are practically permanent and that the "Co-Cro-Cu" tints are stable for several weeks, those blends containing permanganate must be used within a half-hour after mixing.

Before leaving the subject of cudbear, we wish to again emphasize that the matching of this or any other color with our standard colored fluids is now merely a matter of routine work. We hope that others will become sufficiently

interested to check up our work, in order that uniformity in the color of pharmaceuticals ultimately obtain. We further predict that it will be only the matter of a few years before color standardization by methods similar to those we have devised will be given pharmacopeial recognition.

COLUMBIA UNIVERSITY COLLEGE OF PHARMACY, July, 1915.

#### ABSTRACT OF DISCUSSIONS.

Dr. Schneider: I want to ask Dr. Army several questions. Does the thickness of the container have to be considered? What would you suggest as determining a recognizable difference in tint?

Dr. Army: I might say, Mr. Chairman, it would facilitate matters if our friends will ask questions and I will answer them to the best of my ability when they have finished. I am also sorry that I have not a few copies of the Institute paper with me. The details will be found in that.

Dr. Turner: In preparing these colors by means of a colorimeter, is it necessary to come to an absolute match of colors, or will a slight difference of tint affect it enough to change the effect of the color?

Mr. J. U. Lloyd: This question of standard colors confronts us in whatever line of experimental demonstration we may engage. It confronts the botanist and especially the bacteriologist; it confronts the entomologist; it confronts all who attempt to make a description of a substance and describe the color so a person understandingly can get that color. Now, we know that the vegetable colors are, some of them, very permanent. I know that when I went to the Orient to study, that one of the subjects committed to me by the Department of Agriculture was to study the color used in Persia and Turkey in the making of the dyes used in coloring those carpets in the olden times. And I found there carpet that was unquestionably hundreds of years of age, back of Smyrna, carpets that were taken from the floors where they had been for hundreds of years unquestionably, with the colors as bright almost as the day they were made, and vegetable unquestionably. These people were so exceedingly careful concerning the origin of the dyes that they make, which seem to be empirical. Unfortunately the aniline dyes have crept into that country so now it seems the natural dyes of the olden times will be swept out. These vegetable dyes give the mellow shades of the Oriental carpet. These vegetable dyes I consider to be as permanent as any of the dyes we can make on the inorganic side. My brother who is a mycologist, has studied and devoted much of his time in the attempt to arrive at a method of making standard descriptions of the different colors in his line. You know how they are described, how weak some of the descriptions are, and the impossibility of setting them down in black and white. The lithograph man has been appealed to; the painter has been appealed to. It is almost impossible to get the standard shade. Now, there is one red I would like to ask Dr. Army to think of. It is a vegetable red in the line of a standard acid color. That is the shade produced when sanguinarine is dissolved in sulphuric acid. I believe you have a red there you will find to be pretty nearly perfect, and that you can make almost any shade you desire by using the exact amount of sanguinarine dissolved in the exact amount of acid water. It is a very clear cut red, and red is a color that you have trouble with in using endbear. I would like to have you try sanguinarine.

A Member: The average pharmacist is interested in making mixtures, so that in filling prescriptions the patient will not notice any difference in the color. I have found that the darker the color, even if it does not match the former one, the patient will not notice the difference. If the color is lighter, the least difference makes quite an impression on the patient.

Dr. Army: I will answer the questions. As far as Dr. Schneider is concerned, he speaks of the thickness of the container. Of course, in matching the colors there are several ways it can be done. It can be done with the colorimeter. In my own work I have found that I have had satisfactory results by the use of Blake bottles. I started in on the work not to reach scientific exactness, but from the standpoint of matching colors in everyday pharmacy. We use the Blake bottle, holding about an ounce. I might say in our most exact work we use two Lovibond cells, each of which is uniform in thickness.

On the subject of color, it is true that the darker the color is the less we can discern differences in shade in it. That is the reason why in delicate work we always use a half-normal solution, because we see distinctions more clearly in these than in stronger solutions.

Another point is the fact which may be in the mind of some of you, although you have not asked the question: "How do you know the uniformity of these colors?" All the work we have done in our laboratory during the past eight years has been handled as "unknowns." We take these Blake bottles and number them and put the solutions in, and I myself keep the record of them. Then I take a student and ask him to put them in the proper sequence, first the darkest and then the lighter. It is strange how close they can get to it. That opens the question which Dr. Schneider has asked about, the question of how far I can discern distinction on colors, and I am glad that question is asked.

I wish at this time to sound a warning (for it is needed) on the idea of doing quantitative analysis by colorimetric schemes. We recommend colorimetric tests only when the quantity of material to be tested is too small to assay gravimetrically or volumetrically. The sharpest discernable difference in color work is five per cent. We have one solution representing 1 part in 100; another 1 in 110 and another 1 in 90. Dozens of people coming in will put them in the proper sequence. If you have solutions 1 in 90, 1 in 95 and 1 in 100, it takes a fairly good eye to make the distinction, the eye of someone who has studied the subject. If you make then 1 in 92, 1 in 93, 1 in 94 and 1 in 95, nobody can tell. So the limitations of the colorimetric test is say 5 percent which is not, of course, exact scientific work.

The next was the question Dr. Turner asked. I don't know that I have that question exactly.

Dr. Turner: Whether it is necessary to match the color absolutely.

Dr. Army: I will answer by saying that if we have two colored solutions, one consisting of 50 cc. of the cobalt solution, 4 cc. of the iron and 9 cc. of copper and the second made from 50 cc. of cobalt solution, 5 cc. of iron and 8 cc. of copper, the difference in the tints of these two fluids is easily discernable.

As far as Professor Lloyd's statements are concerned, I want to confirm all he says about the uselessness of lithograph work on color standardization. The first thing we did was to find out from the leading lithographers all we could about the subject and they told us that there is considerable difference between the fiftieth and the hundredth impression from the same plate. Therefore with the same ink they cannot guarantee the uniform coloring of successive impressions.

---

## NOTES ON THE HISTOLOGY OF AN AMERICAN CANNABIS.\*

---

C. W. BALLARD, A. M., PHAR. D.

---

There is a difference of opinion relative to the therapeutic value of foreign and native Cannabis; in this article their histological characters are compared.

A number of factors are responsible for the revival of interest in American Cannabis sativa. The foreign drug is apparently becoming less plentiful and is consequently increasing in price. Recent legislation has forced some manufacturers to use this drug in place of opium in their remedies. Last but not most important is the accumulated data as to the therapeutic value of the native drug as compared with the foreign and although there is yet a lack of complete agreement among authorities, the weight of experimental evidence seems to indicate that preparations of American grown cannabis are almost, if not fully, as active therapeutically as those prepared from the foreign drug.

---

\*Presented at Scientific Section, A. Ph. A., San Francisco meeting.

## BOTANICAL CHARACTERS OF THE ENTIRE PLANT.

The sample upon which the following descriptive notes are based was received direct from a collector of crude drug materials. The entire herb with both pistillate and staminate flowers was gathered, so that positive identification and comparison with published botanical descriptions was possible. The foreign hemp being usually shipped in the form of agglutinated tops is not easily compared with descriptions appearing in botanical systems of classification. This sample of native hemp was compared with material furnished by the Bureau of

Plant Industry of the U. S. Department of Agriculture, also with mounted specimens collected in Missouri and Monroe Co., Virginia. The latter specimens were from the Canby Herbarium of the New York College of Pharmacy. All of the above mentioned native specimens correspond with the following description published by Small in "Flora of the South Eastern United States."

"A coarse erect pubescent herb, annual. Leaves alternate or opposite, blades digitately divided into 5 linear or linear-lanceolate, serrate, acuminate segments, 4 to 15 cm. long. Petioles 2 to 8 cm. in length, stipules free and persistent. Staminate flowers in paniced racemes, the panicles being about as long as the subtending leaves. Calyx 4 to 5 mm. broad, consisting of 5 imbricated sepals, oblong or oval, pubescent and obtuse; corolla wanting. Stamens about as long as the sepals, 5 in number. Pistillate flowers in spikes found in the axils of the leafy bracts, having an entire perianth of calyx only, subtending a sessile one-celled ovary. Achenes oval-lenticular 4 to 5 mm. long, variegated, enclosed in the persistent perianth. Embryo curved."

#### COMPARISON OF THE TOPS OF FOREIGN AND NATIVE CANNABIS.

The tops of foreign cannabis are minutely described by the Pharmacopœia and the essential points of this description are here given.

"Dark green or brownish in color, densely branched panicles, the branches of which are compressed and agglutinated by resin into terete or flat masses; clothed with numerous sheathing bracts each containing two small mature but unfertilized pistillate flowers. In the powder few or no pollen grains or stone cells should be present."

The tops of *Cannabis sativa* native, as represented by my sample, present considerable variation in appearance from those of foreign drug and these differences are not only due to methods employed in preparing the latter drug for market but also to the habit of the native drug plant. We must bear in mind that the native drug is obtained from an uncultivated herb; the plant yielding the foreign has undoubtedly been somewhat modified by years of careful cultivation, also the tops of the latter are kneaded or worked into masses, while the native drug does not undergo such preparation. The tops and flowers of the native drug are colored a light green instead of the usual brown tint of the foreign.

#### HISTOLOGICAL CHARACTERS OF FOREIGN AND NATIVE CANNABIS.

For purposes of contrast we may briefly review the histological characters of foreign cannabis, the only variety admissible under present standards. The cellular elements and contents present are:

1. Many curved unicellular trichomes often containing cystoliths of calcium carbonate in the enlarged basal portion of the cavity, margin of the trichome smooth or nearly so, trichomes of two varieties, one of which is short but very broad, derived from the stem and upper leaf epidermis; the other being longer and narrower found on the lower leaf epidermis.

2. Glandular trichomes having a short many-celled petiole.

3. Epidermal tissue of polygonal or wavy cells, the lower epidermis having stoma.

4. Parenchyma or mesophyll containing resin masses, chlorophyll granules and numerous rosette crystals.

5. Small amounts of fibrovascular tissue consisting of thin walled fibers and spiral vessels.

The *Cannabis americana* of the Fifth Revision of the Pharmacopœia con-

sists of flowering tops, and no designation of pistillate or staminate flowers appears. Even in that edition of the Pharmacopeia the pistillate tops only of foreign hemp are designated as official. As the sample described was in the form of the entire herb, we may for convenience divide the cellular elements into those derived from the leafy stems and those from the tops.

*Stem Elements.*—The smaller stems of native cannabis are five to six angled with distinct furrows on the flat sides. The larger stems and those immediately adjacent to the root are circular in outline. In general they are not as stout as the stems of the foreign drug. The upper portions of both have a distinctly hispid surface and it is disagreeable to draw the finger over them, but the native is by far the rougher. The petioles of the leaves have a deep furrow on the upper surface. As stems make up a large portion of the sample submitted, we naturally find large amounts of fibrovascular tissue in the form of long thin-walled fibers with spiral and reticulate vessels. On transverse section the stems of the native drug are found to consist of epidermis armed with numerous short, very rough and stout trichomes; below this is a well defined collenchymatic layer which completely surrounds the fibrovascular elements. In the center is a small pith region the cells of which contain numerous crystals of the rosette type. Transverse sections of the stems of foreign drug exhibit the same elements as the native but there is less collenchyma, fewer and smoother trichomes on the epidermis and a larger pith. The foreign drug has a much greater amount of resin in the form of irregular masses occurring in the parenchyma cells.

The tissue elements of the leaves were very prominent in the powder prepared from the sample under consideration. Such an increase in the amount of leaf tissue might explain the increased number of protective trichomes present in the sample. Transverse sections of the leaf of the native drug show that it has the greater number of protective trichomes on the lower surface, is a thicker leaf and contains less resin than the foreign. The number of glandular trichomes is about equal in the two powders. The chlorophyll granules of the native drug are large and bright green.

*Tops of Native Cannabis.*—The histological differences in powders prepared solely from the tops of foreign cannabis and from those of the sample submitted were fully as striking as the differences in appearance of the drugs in the whole condition. The most apparent feature of the powdered American tops is the abundance of pollen. In a powder of foreign cannabis any abundance of pollen would indicate careless cultivation or gathering and would cause the rejection of the sample on the ground that official drug is defined as consisting of pistillate tops only. Unicellular trichomes of both short and long varieties are found in greater number in the native sample. This difference might be expected when one considers that the native drug is not gathered from cultivated plants as we have other instances where care and cultivation seem to lessen the necessity for protection afforded by trichomes. There are several minor differences in the trichomes of stem and leaf in the two drugs. The trichomes of the tops and more especially the stems of native drug are apt to be more papillate or rough surfaced. In some cases this roughening is so marked as to give the hair a surface appearance similar to that of senna. The cavities of the trichomes of native hemp are smaller than those of the foreign and the cystoliths in the basal portion

are not as numerous. Some of the trichomes of the native drug are but rudimentary appearing as mere papillae.

## SUMMARY

<i>American Sample</i>	<i>Foreign Sample</i>
<i>Pollen</i> Large quantity	very scarce
<i>Trichomes</i>	
number—great	great
surface—very rough	less roughened
size—large and small in equal quantity	more large than small
cavity—small at base	large at base
papillae—on leaf surfaces and stem epidermis	few
<i>Leaf tissue</i> great amount	moderate quantities
<i>Mesophyll</i> bright green	brownish green
<i>Fibrovascular tissue</i> large in amount	small in amount

We must realize that the fragmentary notes here presented are open to review and enlargement. A complete treatment of the subject of *Cannabis sativa* would require investigation of the slight differences in botanical and histological structure not only of a few samples of the two drugs but of many specimens from as wide a range of territory as possible. If the materials for such a study were available we would undoubtedly find many minor differences resulting from climatic conditions.

COLUMBIA UNIVERSITY, COLLEGE OF PHARMACY.

## THE CULTIVATION OF MEDICINAL PLANTS WITH OBSERVATION CONCERNING CANNABIS.\*

L. E. SAYRE.

The Author dwells upon the importance of cultivation of medicinal plants in the United States. He has recently traveled in the South and refers to the advantages of Georgia's climate and soil for medicinal plant cultivation and the advantageous location of experiment stations of that State. The Author refers to some experimental work at Glenolden and states that despite contrary statements, *Cannabis* is an important and reliable drug.

One of the first experiments in the cultivation of medicinal plants in the United States on which the author was in position to make some personal observations was about the year 1887 when a friend of his (Mr. C. B. Allaire) had received through Dr. E. R. Squibb some genuine Trieste seed of the official fruit, colocynth. Mr. Allaire kindly asked the writer's co-operation in the experimental research—he to cultivate the plant (near Albuquerque), and the writer to make an analysis of the fruit product when it had matured. To the writer's surprise a barrel of this fruit was received which was nearly as large as a small water melon. This enormous size, it was found, was due to hybridization. Mr. Allaire had not taken the proper precaution to isolate the colocynth patch. It had been

\*Read before Scientific Section, A. Ph. A., San Francisco meeting.

located too closely to a garden plat of water melons. On analysis, the fruit proved to be less bitter than the official fruit; proportionately diluted.

Since this time the writer has taken much interest in the cultivation of medicinal plants and while he has not done much in an agricultural way he has watched with intense concern the experimental work in the Bureau of Plant Industry in Washington and the individual efforts of others. Professor Schneider of San Francisco has reported his work in cultivating belladonna on an extensive scale. We have examined the leaves and roots of the plants from his field and found them remarkably rich in alkaloidal content. Our own native stramonium, without special cultivation, has been repeatedly examined and reported upon by us as furnishing the official alkaloidal requirement. It is needless to give further detail to show that the writer's interest is more than academic.

During the past summer the writer has had a splendid opportunity of making certain observations in connection with this subject which through the persuasion of a committee of this Section of the American Pharmaceutical Association, he has been induced to record in its proceedings, or in other words, to present a paper upon it.

It has been repeatedly stated, by various writers in our pharmaceutical journals, that now is the opportune time for a special effort to be made in this country to make itself, as far as possible, independent of foreign supply and to encourage home production of plants producing remedial agents.

During the past summer it has been the writer's privilege to study a section of the South which seems to him especially favorable for this purpose. I refer to the section included in an area which lies around and about Atlanta, Macon, and Savannah. Doubtless many other adjacent positions may be as favorable for the above purpose. Traveling through this district (mostly on wheels however) the writer has been very much impressed with the immense variety of plants, of different orders, growing wild there and of the splendid system of Georgia in distributing experimental farms at advantageous geographical intervals throughout the State. This system, in this section, if taken advantage of, in such a way as to include medicinal plants would doubtless lead to favorable economic results. In spite of all that has been said to discourage this enterprise in this country, it seems we should do something, as an Association to promote this growing need.

This idea receives substantial support when we observe, for instance, that one of our large manufacturing chemists, encouraged by former experimentation, in Philadelphia, has now under cultivation several acres of medicinal plants, such as belladonna, digitalis, hyoscyamus and cannabis. At Glenolden, Pa., the writer had the opportunity of seeing these fields of medicinal plants growing vigorously. Doubtless there are many other sections where this enterprise has been started and developed, and since this is the case, it would be wise for this Section of our Association to have a committee whose object it would be to collect statistics, to foster and promote the praiseworthy object, and to furnish reliable information as to possibilities in medicinal plant culture in this country. This information may be had for the asking and those who are engaged in this form of plant culture would be only too glad to contribute to the common fund of

information. The plea we would make, then, would be for a proper organization of promoting this work in the line above indicated.

In connection with the subject of plant culture, attention is naturally directed to the fact that there is a growing tendency to discard this class of plant remedial agents. Recently there was a circular letter sent out by the Council of Pharmacy and Chemistry of the American Medical Association, which urged the discontinuance of cannabis as a useful drug on account of its alleged variable-ness in quality and uncertainty of action. On this point we wish to call attention to the fact that cannabis, (both the *C. Indica* and *Americana*) do not by physiological test give any greater variation than the other prominent potent drugs.

Quoting from reliable published statements we would cite the results of Pittenger (see his book *Biochemic Drug Methods*, page 6). Adding thereto we have the following instructive tables recording more recent unpublished results:

The following table shows the comparative results of both the physiologic and chemic assay of the three varieties of Cannabis:

TABLE NO. I.

CANNABIS INDICA		CANNABIS AFRICANA		CANNABIS AMERICANA	
Chemical Assay	Phys. Assay	Chemical Assay	Phys. Assay	Chemical Assay	Phys. Assay
12.2% resin		10.6% resin	100%	6.4% resin	133%
12.7% resin		16.7% resin	133%	14.4% resin	100%
14.2% resin	100%	14.2% resin	133%	14.1% resin	100%
12.8% resin	100%	8.6% resin	100%	8.5% resin	114%
13.0% resin	80%	10. % resin	133%	10.8% resin	260%
13.4% resin	66%	17.5% resin	20%	8.5% resin	200%
98.7% resin	125%	18.8% resin	100%		133%
	200%	17.8% resin	83%		133%
	266%		200%		
13.2% resin	133%			16.2% resin	200%
94.6% resin	166%				200%
12.0% resin	200%				100%
	133%				133%
	133%			16.8% resin	133%
13.0% resin	133%				80%
	133%				150%
	220%				133%
	160%				200%
	80%				66%
12.0% resin	400%				200%
12.0% resin	400%				90%
11.4% resin	100%				160%
9.9% resin	125%				100%
					133%
				10.8% resin	200%
				10.8% resin	260%
				8.5% resin	114%

TABLE NO. II.

Drug	Number of Samples Assayed	Variation Percentage
Digitalis tincture .....	51	30 to 444
Ergot fluidextract.....	17	0 to 310
Aconite leaves tincture.....	6	38 to 111
Aconite root tincture.....	12	33 to 363
Cannabis indica fluidextract.....	15	40 to 150
Gelsemium tincture .....	7	61 to 156
Strophanthus tincture .....	12	55 to 277
Squill fluidextract .....	13	71 to 153

It will be noted from the tables that,

- 16 samples of Belladonna leaf varied in strength from 121.0% to 200.0%.
- 22 samples of Belladonna root varied in strength from 91.1% to 155.5%.
- 10 samples of Cinchona yellow varied in strength from 105.8% to 182.6%.
- 14 samples of Cinchona red varied in strength from 136.6% to 203.0%.
- 10 samples of Coca leaf varied in strength from 118.8% to 230.0%.
- 6 samples of Colchicum seed varied in strength from 115.5% to 222.2%.
- 8 samples of Gelsemium varied in strength from 85.5% to 164.5%.
- 14 samples of Hyocyanus varied in strength from 47.7% to 137.5%.
- 15 samples of Ipecac, whole, varied in strength from 54.2% to 135.0%.
- 8 samples of Ipecac, powdered, varied in strength from 76.6% to 144.0%.
- 13 samples of Jalap varied in strength from 72.4% to 132.0%.
- 18 samples of Nux Vomica varied in strength from 36.8% to 106.4%.
- 4 samples of Pilocarpus varied in strength from 60.6% to 189.6%.
- 8 samples of Podophyllum varied in strength from 66.7% to 132.0%.
- 11 samples of Sanguinaria varied in strength from 131.2% to 273%.
- 11 samples of Stramonium leaf varied in strength from 121.6% to 208.0%.
- 6 samples of Veratrum varied in strength from 130.0% to 214.0%.

According to the tables, it would appear that *Cannabis sativa* is no more variable than many of the other drugs of the Pharmacopoeia.

A detailed outline of the methods which were employed for physiologically standardizing *Cannabis* and its preparations is given on pages 97 and 102 of the volume mentioned.

It is needless to say that any effort to discontinue a drug or remedial agent will be of little avail if that drug proves itself useful and important in the hands of physicians who obtain favorable clinical results from its use.

Drugs are sometimes useful to those only who know how and when to use them, and, those who have had favorable experience with them as "tools," in the treatment of disease cannot be dissuaded from their use by the mere dictum of any medical or pharmaceutical body.

---

## A BIOLOGICAL TEST FOR ARSENIC\*

ALBERT SCHNEIDER.

---

The test for arsenic about to be described is not new as it has been used in Germany and other European countries for some time. It is, however, quite new to American laboratory workers and is hereby given for the benefit of those who are not familiar with it.

Arsenic is widely distributed in nature and is extensively used in the arts and industries. Medicinally it is a popular tonic and it is also much used as an insecticide in the form of sprays and washes. Animal hides are frequently preserved by arsenic, which accounts for the presence of this powerful poison in glues and gelatins made from such hides. Fruits and vegetables which have been sprayed with arsenical compounds for the purpose of destroying insect pests, may contain enough of this substance to produce symptoms of poisoning. Arsenic is occasionally added to alcoholic beverages to give them a tonic effect. It has been demonstrated that very minute amounts of arsenic are normally present in various organs of the human body, as the thyroid gland, the thymus

---

\* Presented in Scientific Section A. Ph. A., San Francisco meeting.

gland and liver, although some investigators question the correctness of this claim. However these somewhat problematical traces of arsenic in organs of the human body and also in the organs of other animals need not concern the routine laboratory workers.

As a rule, the tests for arsenic outlined in the majority of texts are chemical and hence this work is usually relegated to the chemical laboratory. Within recent years attempts have been made to employ biological tests for determining the presence of arsenic in food substances based upon the discovery that certain molds when growing in substances containing arsenic will give rise to garlic-like odors.

Gosio demonstrated that certain molds grown in and upon media containing very minute quantities of arsenic gave rise to gaseous compounds characterized by a garlic-like odor. Seven different species of molds are said to have this power, more especially *Penicillium brevicaulis*, which Gosio isolated from the air and which he frequently found on decomposing paper. Crumbs of bread (wheaten) form the best culture medium for this mold and the incubation is done at a temperature of from 28° to 32° C., a vigorous growth being produced within 24 hours. In the presence of not more than 0.00001 gram of arsenic in such culture there will be noticeable a distinct and very characteristic garlicky odor which may persist for months, if the culture is not killed. These arsenic molds do not produce garlic odors with sulphur, phosphorus, antimony, boron and bismuth compounds but they do have the power of converting selenium and tellurium compounds into volatile substances having the garlic-like odor. The following is the method of procedure in making the test:

If the material to be examined is liquid, let the dry bread crumbs (either white or graham) absorb it to saturation, and then scatter a small quantity of fine crumbs over the surface. If the material to be tested is solid, grind or cut it into small pieces and mix with an equal amount of bread crumbs and then moisten with a little sterile distilled water. Place the prepared material in sterile flasks of suitable size and plug with sterile cotton. Sterilize the flask and contents by the usual fractional method at 100° C., or for 30 minutes in the autoclave. Absolute sterilization must be secured. There is no danger of volatilizing the arsenic at these temperatures. As soon as the flask and contents are cold, inoculate with the mold, as follows: The mold cultures may be grown on bread or on pieces of potato. Remove a small quantity of the mold in the spore-forming stage and mix with peptone salt solution or sterilized water. Add enough of this mold suspension to moisten the bread in the flask. Do not add more of the spore-bearing material than the mass (bread and arsenical substance) in the flask will absorb, as too much moisture will retard the growth of the fungus. Cover the inoculated flask with a rubber cap and incubate at a temperature of 37° C., although the ordinary room temperature will answer the purpose. As soon as the growth is clearly visible to the naked eye, which may be within 24 hours, the characteristic garlic odor will be noticeable on opening the flask. If no odor is appreciable, again seal and incubate for another 24 hours or longer. In case the substances to be tested are strongly acid, they may first be neutralized by means of calcium carbonate. It must be kept in mind that *Penicillium brevicaulis*, as well as other molds, will convert tellurium

and selenium compounds into volatile substances having a garlic-like odor. The arsenic and tellurium odors are closely similar but that from selenium is somewhat different in quality, more like that of mercaptan. The test is extremely delicate, 0.00001 gram of arsenic can be recognized with certainty. A solution of 0.00001 gram of potassium tellurite in 10 cc. of mold infested gelatin medium, in a cotton plugged test tube, gave out a strong odor of garlic for several weeks.

Bigineili ascertained that the gases formed by *Penicillium brevicaulis* in arsenical cultures were completely absorbed by solutions of mercuric chloride with the formation of a double compound of mercuric chloride and diethyl arsine which is quite easily decomposed, accompanied by the reappearance of the garlic odor. The test is unlimited in its application and will respond in the presence of all manner of organic substances and bacterial contamination. It is far more delicate than any of the chemical tests for arsenic and can be carried out in much shorter time.

FRANK H. FREERICKS,  
Chairman of Section on Education and  
Legislation.

H. P. HYNSON,  
Chairman House of Delegates.

In the October issue, page 1167, error was made in announcing Mr. R. S. Lehman instead of Mr. Freericks as Chairman of the Section on Education and Legislation. Mr. Lehman is Chairman of the Section on Commercial Interests.

## Section on Education and Legislation

Papers Presented at the Sixty-Third Annual Convention

### MINUTES OF THE PROCEEDINGS OF THE FIRST SEPARATE SESSION OF THE SECTION ON EDUCATION AND LEGISLATION.\*

The first separate session of the Section on Education and Legislation was held in the Red Room of the Bellevue hotel, San Francisco, on Thursday, August 12, beginning at 11 o'clock a. m.

Chairman F. H. Freericks presided and in the absence of Secretary R. A. Kuever, Professor Edwin L. Newcomb acted as secretary pro tem.

Chairman Freericks in opening the meeting said:

You will all remember that the joint session of this Section and the Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy was held Wednesday morning, so that we will now take up in order that part of the program which is scheduled for Thursday morning at 11 a. m., instead of as it appears on the program.

With your permission I should like to present the Secretary's Address, which is a statistical report very largely, and the purposes of which, I believe, would be satisfied by a mere reading of the title.

It was then moved by Prof. H. V. Arny and seconded by Dr. W. C. Anderson that the Secretary's Report be referred to the Publication Committee, which motion was carried.

#### REPORT OF SECRETARY KUEVER.

The by-laws of our Section prescribe, as one of the duties of the Secretary, the compiling of an annual report. This report, when properly made, should embrace all the progress in legislative and educational matters; it reports, pharmaceutically speaking, all educational advances and legislative changes in such a way that it becomes a permanent record and a part of the proceedings of each convention of the American Pharmaceutical Association.

In keeping with the usual custom, your Secretary has this year, divided his report into two sub-heads, Educational Advances and Legislative Changes, and has sub-divided each of these according to the states, alphabetically arranged, in which the changes have been enacted and according to the schools in which educational advances have been adopted.

An effort has been made to make this report complete, covering every institution of pharmaceutical learning and every state, but owing to the lack of a few responses from some of the schools of pharmacy it may possibly be that not all educational advances are here recorded. From a few states it was impossible to obtain authentic reports regarding legislative changes even after several letters were sent to the Secretary of the State Association and other pharmacists in the state.

It is interesting to note, in this connection, that Wyoming is the only state in the Union in which there is no state pharmaceutical association at the present time.

\*Papers read before the Sections will be accompanied by the discussions and are therefore omitted from the minutes.

Your Secretary desires to make one suggestion and that is that the by-laws of this Section be amended at this convention to read that the Secretary shall be elected for a term of two years in place of one. It is very evident that a Secretary serving two consecutive years, because of the way in which our state legislatures meet, the variance of the time of the year when the various state associations convene, and the gradual nature of the changes in educational advances, can be of a great deal more service than can a new man, much less familiar with the work, who is chosen annually.

#### EDUCATIONAL ADVANCES.

According to the last issue of the hand book of the State of New York there are eighty-two schools of pharmacy in the United States. Forty-five are classed as registered schools and thirty-seven as accredited institutions. Of these eighty-two schools the following three have been discontinued during the fiscal year.

(1) School of Pharmacy, Medical Department, Texas Christian University, Fort Worth, Texas. The last class was graduated in 1914.

(2) College of Pharmacy, New Orleans University, New Orleans, La. The last class was graduated in 1915 and arrangements have been made whereby the undergraduate students will continue their work at Meharry Pharmaceutical College, Nashville, Tennessee, during the ensuing year.

(3) Department of Pharmacy, Starling-Ohio Medical College, was merged with the College of Pharmacy of Ohio State University during July, 1914.

The following schools of pharmacy, twenty-seven in number, report that no specific educational advances, either in entrance requirements or curriculum, has been adopted during the past year. In a few cases the former would hardly be possible since four years of preparatory work is already required for entrance. In the majority of cases, however, the requirements are exceedingly low—being but one year of high school work.

The schools are here arranged with regard to their entrance requirements.

I. Those having a minimum entrance requirement of one year of high school work:

- (1) Kansas City College of Pharmacy and Natural Science.
- (2) New Orleans College of Pharmacy.
- (3) Louisville College of Pharmacy.
- (4) Toledo University College of Pharmacy.
- (5) College of Pharmacy of the Birmingham Medical College for the Pharmaceutical Graduate degree.
- (6) Central States College of Pharmacy.
- (7) College of Jersey City, Department of Pharmacy.
- (8) Albany College of Pharmacy.
- (9) Southern College of Pharmacy.
- (10) University of Tennessee School of Pharmacy.

II. Those having a minimum entrance requirement of two years of high school work.

- (1) Medico-Chirurgical College of Philadelphia, Department of Pharmacy.
- (2) School of Pharmacy, University of Oklahoma, for the Pharmaceutical Graduate degree.
- (3) Meharry Pharmaceutical College, the two years must include one year each of Latin and physics.
- (4) Pittsburgh College of Pharmacy, after 1916-17.
- (5) Marquette University, School of Pharmacy, for the Pharmaceutical Graduate degree. The registrar of this institution says, "Wisconsin is a backward state in pharmaceutical legislation. Young men need attend no pharmacy school in order to be eligible to the State Board examination. We are still compelled to give 'Short Courses' in pharmacy. We had sixty-six such students last session."

- (6) The State College of Washington, for the Pharmaceutical Graduate degree.
- (7) North Dakota Agricultural College, School of Pharmacy.
- (8) Cincinnati College of Pharmacy.
- (9) School of Pharmacy of the University of Alabama.

III. Those having a minimum entrance requirement of three years of high school work:

- (1) School of Pharmacy, University of Oklahoma for the Pharmaceutical Chemist and Bachelor of Science degrees.
- (2) Tulane School of Pharmacy.
- (3) National College of Pharmacy.

IV. Those having a minimum entrance requirement of four years of high school work:

- (1) Marquette University, School of Pharmacy for the Pharmaceutical Chemist and Bachelor of Science degrees.
- (2) College of Pharmacy of the Birmingham Medical College for the Pharmaceutical Chemist and Bachelor of Science and Doctor in Pharmacy degrees.
- (3) Purdue University, School of Pharmacy.
- (4) University of Washington College of Pharmacy.
- (5) The State College of Washington for the Bachelor of Science in Pharmacy degree.

The following schools of pharmacy, nineteen in number, have adopted educational advances during the past fiscal year. Some are reporting increases in entrance requirements, some have lengthened or added to their curriculum and others have done both.

These schools are arranged with reference to their entrance requirements.

I. Those which have required one year of preparatory work for admission:

- (1) Pittsburgh College of Pharmacy. In 1917-18 two years of high school work will be required.
- (2) Massachusetts College of Pharmacy. In 1917-18 two years of high school work will be required.
- (3) Medical College of the State of South Carolina School of Pharmacy. The teaching of pharmacology, in the senior year, has been added to the course of study.
- (4) Temple University, Department of Pharmacy. A course of Homeopathic pharmacy consisting of six lectures and six laboratory periods has been added.
- (5) Buffalo College of Pharmacy. Two hours weekly of senior pharmacy laboratory work and one hour weekly of the pharmacognosy of powdered drugs has been added.
- (6) Creighton University College of Pharmacy. The course of study has been increased from fourteen to sixteen months.
- (7) School of Pharmacy, Medical College of Virginia. This institution requires one year of high school work for the Pharmaceutical Graduate degree. A new course has been established leading to the Pharmaceutical Chemist degree for which four years of high school work is required.
- (8) Howard University Pharmaceutic College will require two years of high school work including one year of Latin.
- (9) Cleveland School of Pharmacy has added one year of high school work, requiring for the coming year two years for entrance.
- (10) Northwestern University, School of Pharmacy, has lengthened its courses to eight and one-half months in each year.

II. Those which have required two years of preparatory work for admission:

(1) University of Illinois, School of Pharmacy requires two years of high school work for the Pharmaceutical Graduate degree and four years for the Pharmaceutical Chemist degree. Beginning with the session 1916-17 four years will be required for entrance to the course leading to the degree Pharmaceutical Graduate.

(2) Brooklyn College of Pharmacy. The Pharmaceutical Doctor degree formerly given for three years of work with thirty regents counts will hereafter be given after six years of instruction and an entrance requirement of sixty regents counts. The Pharmaceutical Chemist degree is now given for three years course with sixty regents counts for admission. The Master of Pharmacy degree is now given for three years of work with thirty regents counts as entrance requirements.

(3) Department of Pharmacy, University of Mississippi. A three years course has been added leading to the degree Pharmaceutical Chemist. Four years of high school work is required for admission.

(4) California College of Pharmacy. A system of reporting laboratory work in chemistry and materia medica has been adopted. A new botanic garden has been established.

(5) University of Montana, School of Pharmacy. Requirements for the three years course, degree Pharmaceutical Chemist, are advanced to four years of high school work. Requirements for two years course, degree Pharmaceutical Graduate, are advanced to three years of high school work with the following provisions: Students of mature age, with drug store experience, may be admitted on presentation of seven and a half units. Special students who must be twenty-one years of age, and not candidates for a degree, are admitted without entrance requirements.

III. Those which have required two years of preparatory work for admission:

(1) College of Pharmacy, University of Nebraska. By act of the Nebraska legislature the School of Pharmacy was made a College of Pharmacy.

(2) College of Pharmacy, State University of Iowa. Four years of high school work is the minimum entrance requirements to both courses for Pharmaceutical Graduate and Pharmaceutical Chemist degrees. A four years course leading to the degree, Bachelor of Science in Pharmacy, is being established.

(3) School of Pharmacy, Vanderbilt University, has added more work to the course leading to the Pharmaceutical Chemist degree. Arrangements have been made whereby the degrees Bachelor of Science and Pharmaceutical Chemist may be taken together in a five years course.

(4) College of Pharmacy, University of Minnesota, has adopted a three year minimum course of pharmaceutical instruction to go into effect 1916-17. In educational advances, therefore, this institution leads the schools of pharmacy in this country.

LEGISLATIVE CHANGES.

During the past fiscal year there have been a great many legislative changes affecting the profession of pharmacy. For this, two reasons may be given: The large number of General Assemblies in the odd numbered years and the unusually important Federal legislation passed by Congress. As an example, in many states, narcotic laws have been enacted which conform to the Harrison law, and so on.

At the time this report is being compiled there are still a few legislatures in session or bills in the hands of Governors and hence this report may not be entirely complete.

In the following legislative summary the states are arranged alphabetically regardless of whether or not any legislative changes have occurred. Because of the vast amount of legislative material the summary is made as brief as possible.

ALABAMA: The legislature convenes during the month of July, hence is in

session at present. The state association is attempting to secure some pharmaceutical legislation during the present session.

ARIZONA: No change in the laws affecting pharmacy since 1913.

CALIFORNIA: Three bills affecting pharmacy are in the hands of the Governor.

COLORADO: Two laws were passed:

I. A prohibition law which allows, under certain restrictions, the dispensing of not more than four ounces of liquor on a prescription.

II. A narcotic law which supplements the Harrison law and places a limit upon the amount of the various drugs that may be dispensed on one prescription. It also requires that the prescription shall bear the physician's state license number as well as his federal registry number, and further, that the prescription must be filled not later than ten days after the date on which it has been written.

DELAWARE: There were no laws affecting pharmacy passed during the last session of the legislature in this state.

DISTRICT OF COLUMBIA: During the past fiscal year there has been no congressional legislation for the District of Columbia which affects pharmacy.

FLORIDA: Several changes affecting the general practice of pharmacy and also a new narcotic law were enacted.

GEORGIA: Legislature is in session now. So far no pharmaceutical legislative changes have been attempted.

IDAH0: During the last session only one change was made in the pharmacy law. The number of the bill making this change was House Bill No. 249, by Ellrod. This law repeals several sections relative to the sale of certain narcotic drugs and substitutes more in uniformity with the Federal narcotic act.

ILLINOIS: General Assembly in session. Several bills affecting the pharmaceutical profession are pending.

IOWA: Several very important bills were passed.

I. The Barmmer-Jackson bill which amends the Pure Drug act so that everybody handling drugs or medicines (including physicians) must comply with its provisions and be subject to inspection by the commission of pharmacy.

II. The Becker-Taylor bill which amends the present law so that the State Board may prosecute violations without having to prove a specific sale in each case. Convictions under the old law were difficult to obtain because of the lack of evidence.

III. Anti-narcotic legislation was secured by obtaining amendments to different sections of the present statutes instead of passing an entirely new act. The state law was amended so that violations of the national act would be punished by state officials.

IV. A law was enacted which places the Board of Examiners on a salary and the state has been divided into three districts, with one member of the Board in each district for which he is responsible so far as the enforcement of law is concerned.

KENTUCKY: No General Assembly in this state this year.

MAINE: There were no changes enacted into the pharmaceutical law at the last session of the legislature.

MARYLAND: An anti-narcotic law was enacted which goes into effect June 1st, 1916.

MASSACHUSETTS: This state has had four very important changes which are as follows:

I. Chapter 200, General Acts 1915, provides that it is optional with local licensing authorities whether or not any licenses to sell intoxicating liquor shall be granted to druggists in their respective cities and towns, by changing the word "shall" to "may" in Section 22, Chapter 100 of the Revised laws.

II. Chapter 104, of the General Acts of 1915, Chapter 495 of the Acts of the year 1910 is hereby amended by striking out Section 2 and inserting in place thereof: Section 2, The analyst, or an assistant analyst of the State Department

of Health shall, upon request, furnish a signed certificate under oath of the result of the analysis provided for in Section 1 to any police officer or any agent of an incorporated charitable organization and the presentation of such certificate to the court by any police officer or agent of any organization shall be prima facie evidence that all the requirements and provisions of Section 1 have been duly complied with. This certificate shall be sworn to before a justice of the peace or notary public, and the jurat shall contain an allegation that the subscriber is the analyst or an assistant analyst, and of the fact that he is such.

III. Chapter 187, of the General Acts of 1915 makes the State narcotic law conform with the Harrison Act. It contains all the requirements of the United States law but is a little more stringent.

IV. Chapter 159, of the General Acts of 1915 relates to the issuing of search warrants for narcotic drugs.

MICHIGAN: Only one change was made in this State which was the modifying of the narcotic law so that it would not conflict with the Harrison law.

MONTANA: An entirely new and revised pharmaceutical law was enacted which goes into effect July 1st, 1915. It embraces nothing, however, that some other States do not have. The important changes were: (1) fees for examination raised from \$5 to \$15; (2) Secretary's salary increased from \$150 to \$600; (3) reciprocity granted to those complying with the requirements set forth by the Board of Examiners; (4) that paragraph of the old law wherein towns of less than 500 inhabitants were not governed by the pharmacy law was stricken out.

NEBRASKA: Revision of the narcotic law to conform to the Federal act.

NEVADA: No changes during the last session of the legislature.

NEW JERSEY: No changes during the past year.

NEW MEXICO: No changes during the past year.

NEW YORK: Assembly Bill 2185 became a law on May 3rd and amends the public health law in relation to the practice of pharmacy. The Boylan law was amended by the Bloch Bill to make it conform with the Harrison law. The Bloch amendment also provides for the sale of chloral hydrate.

NORTH CAROLINA: The change in the laws in this state, which goes into effect January 3rd, 1918, provides that in order to become licensed as a pharmacist the applicant shall have attended a reputable school or college of pharmacy or medicine for not less than nine months.

NORTH DAKOTA: State pharmacy law, beginning 1915, requires all registered pharmacists to be graduates of a school of pharmacy granting the degree of Ph. G. or better.

OHIO: The change in the law in this state provides that an applicant for State examination must be a graduate from a reputable college of Pharmacy and also provides that an apprentice shall be registered with the State Board of Pharmacy.

OREGON: In this State two laws of importance have been enacted. Section 14 provides for changes in the procedure of becoming registered and Section 12 provides a method for the sale of ethyl alcohol by means of registration and the making of affidavits for the sales of the same. Books are supplied for that purpose.

PENNSYLVANIA: One law was enacted in this State which provides that all persons applying for examination must be, among other qualifications, a graduate of some reputable and properly chartered college of pharmacy of this or some other state, or any foreign country whose pharmacy licensing board or other authority recognizes the graduates of the reputable and properly chartered colleges of pharmacy of this state, and admits the graduates of all such colleges to its pharmacy licensure examinations.

RHODE ISLAND: Amendment to their narcotic law to conform to the Federal act.

SOUTH CAROLINA: No change during the last year.

SOUTH DAKOTA: A law, regulating the sale of common poisons in communities

where there is neither a drug store nor a registered pharmacist, was enacted. The narcotic law was changed to conform to the Federal act.

TENNESSEE: One new law was enacted in this state which regulates the handling of intoxicating liquor by druggists.

TEXAS: No changes have been reported during the past year.

UTAH: Three laws affecting pharmacy were passed: (1) governs the compensation of the members of the Pharmacy Board and provides that all funds collected by the Board must be turned into the office of the State Treasurer in place of being dispersed by the Board itself; (2) provides the Board with power to revoke certificates of registration, and (3) repeals all poison laws and substitutes a narcotic law covering the sale of all poisons.

VERMONT: A change was made in the narcotic law to conform to the Federal act and to cover the sale of cannabis indica.

VIRGINIA: No changes reported.

WASHINGTON: No legislative change reported. The State Board of Pharmacy has adopted a resolution which provides for graduation from a reputable school of pharmacy as a prerequisite to the licensing examination.

WISCONSIN: One law was passed which was introduced as Senate Bill No. 343 S. by Rollman. It provides for compensation for the Secretary of the Board and specifies his duties and it also provides for reciprocity with other states.

Chairman Freericks: We have a number of very interesting papers on the program this morning, but some of the writers are absent. It is for you to decide whether these papers shall be read by title or whether you will hear them. The first paper is by Dr. W. H. Zeigler of the Department of Pharmacy of the Medical College of South Carolina at Charleston, and is entitled, "Should Pharmacology be Taught in Schools of Pharmacy? If So, to What Extent?" Is it your pleasure to have this paper read or should it simply be read by title, as it has been so read, and referred to the Publication Committee?

Moved by Dr. Binz and seconded by Dr. Chism, that the paper be read by title and referred to the Publication Committee; motion carried.

Chairman Freericks: The next paper is by Mr. Charles P. Valentine, entitled, "More English for the Pharmacist." Mr. Valentine is instructor at the University of Montana. What is your pleasure with reference to this paper? Shall it be referred to the Publication Committee or do you desire to have it read?

Moved by Dr. Anderson and seconded by Dr. Binz that the paper be referred to the Publication Committee; motion carried.

Chairman Freericks: The next paper is that of Mr. Gathercoal, entitled, "The Teaching of Materia Medica in Medical Colleges."

Dr. Binz: I should judge it is a very interesting subject and one very valuable to pharmacy, and if it is not too lengthy, I would prefer to have it read and would move that the paper be read. Whereupon Mr. Freericks read the paper by Mr. Gathercoal.

The Chairman: The next regular paper on the program is by Miss Zada M. Cooper, the Associate of this Section, and is on the subject, "Should a Library Reading Course be Made a Part of the Curriculum of Schools of Pharmacy?"

The paper was read by Miss Cooper and after discussion referred for publication.

Chairman Freericks: We have a most interesting paper from Prof. E. Fuller-

ton Cook, who, unfortunately, is not with us. The subject, is "Notes on the Teaching of Dispensing in the College of Pharmacy Laboratory."

The paper was read by Professor Newcomb and afterwards referred for publication.

Chairman Freericks: There are just a few small matters which will close the morning session. There was referred to this Section by the General Session some recommendations from Dean Wulling of the Conference of Faculties. I will read them. I do not quite know how we will act on them, but that can possibly be taken up as the matter is presented to you. Dean Wulling, as President of the Conference, made the following recommendations which were reported on favorably by the Committee on President's Address:

First, that a Standing Committee on Higher Educational Standards be appointed by the President of the Conference to work jointly with similar committees of the American Pharmaceutical Association and National Association of Boards of Pharmacy, National Association of Retail Druggists and State Associations, said Committees to work with the President of the Association as well as jointly.

Second, that a Special Committee on the Federation of all Pharmaceutical organizations be appointed.

Now, I take it that this was referred to our session because it pertains to educational matters.

No doubt it was desired to have either an approval or disapproval of the suggestions and thus refer the matter back to the General Session.

The Chair, therefore, would declare in order a motion to approve or disapprove of these recommendations as made by Dean Wulling.

Dr. Anderson: I would like to move that the recommendations be approved as suggested by Dean Wulling of the Conference of Faculties.

The motion was seconded by Dr. O. F. Claus.

Chairman Freericks: Are there any other remarks?

The motion having been regularly made and duly seconded, and the question called for, the same was declared carried.

Chairman Freericks: We have a communication that was addressed to our President, Mr. Mayo, coming from the Department of Agriculture pertaining to wood alcohol.

The communication is from S. F. Acre, in charge of the Section of Derived Products. It isn't a very long communication and I believe coming from an official department it should have the attention of our Section.

Thereupon the letter was read as follows:

March 23, 1915.

Caswell Mayo, President, American Pharmaceutical Association:

MY DEAR MR. MAYO: At the request of the National Wood Chemical Association, I was appointed by our director, Howard F. Weiss, to go thoroughly into the study of the industrial use of methyl alcohol and the dangers incident thereto. I have been extremely anxious to learn the conditions under which wood alcohol is used industrially so that I could make recommendations that would allow the manufacturers to use this material in every legitimate way and at the same time protect the public against any dangers coming from this material. It is agreed by all of us that wood alcohol is a poison and should never be used in any article of food, drink, medicinal, or toilet preparations, nor should its vapors in concentrated form be

inhaled in unventilated spaces such as beer vats. We are doing everything we can to educate the public along this line and the manufacturers and refiners of wood alcohol are aiding us in every way possible. They are also encouraging uniform legislation in different states with the idea of protecting the public against the misuse of their products. I suggested to Mr. E. B. Stevens, president of the Wood Products Company, Buffalo, and who is the representative of the above-named association with whom we are dealing directly, that one of the most effective steps that he could take to protect the public and at the same time help to bring about the uniform legislation so necessary for the stability of his business is to co-operate with you in having the National Association Retail Druggists and the American Pharmaceutical Association pass resolutions to the effect that every wholesale and retail druggist must label every container of wood alcohol in his possession or sold by him with a proper poison label and warning somewhat like the following:

```

.....
:               P O I S O N               :
:               Wood Alcohol               :
: "WARNING—It is unlawful1 to use :
: this fluid in any article of food, :
: beverage or medicinal or toilet :
: preparation for human use, inter- :
: nally or externally."                 :
:.....

```

If such a resolution is passed by your association, you could start a propaganda in your publications, recalling to the druggists the fact that wood alcohol is a poison when taken internally and may produce blindness and death, and that it is their duty to educate the public to these facts and prevent accidents by labeling the containers sold and giving information to ignorant people that wood alcohol is different from grain alcohol. I have collected most of the facts bearing on the industrial use of this material and have a large number of references to cases of blindness and death arising from the misuse of this material, and I should be very glad indeed to place these at your disposal for use in your editorials.

Mr. Edward Williams, Secretary of the State Pharmacy Board, Madison, Wis., has assured me that you will co-operate very heartily with us to secure this end. I shall be in New York in the near future, at which time I shall be glad to call on you and have a thorough discussion of this question. Mr. Stevens is now conferring with the Society for the Prevention of Blindness and a number of eminent medical men in order to learn their views as to the proper labeling of this material. After he and I have had another conference, I could then come to see you again when we could put the matter in its final form for presentation to your association for action and for publication. I shall be very glad to hear from you at once to learn whether you are in sympathy with our efforts along this line and will co-operate heartily with us. I can assure you that the efforts which you could make in our behalf would be of untold importance to the health and convenience of the people of the United States. I am endeavoring to arrange the matter so that we can have uniform federal and state legislation concerning this subject and I have already secured the hearty co-operation of the proper federal authorities in Washington, several state officers, and a number of societies and eminent medical men.

Very truly yours,

(Signed) S. E. ACRES,

In Charge, Section of Derived Products.

Chairman Freericks: Now that this communication has been read the Chair would entertain a motion to receive it, and declare that such a motion is in order. Shall I take up the recommendation separately or shall I first receive the communication?

Mr. Army: First receive the communication.

<sup>1</sup>The word "dangerous" was substituted by the Section

Chairman Freericks: Is there a motion to receive the communication?

Moved by Mr. H. V. Army and seconded by Mr. Louis Emanuel, that the communication be received; motion carried.

Chairman Freericks: There is, as you will remember, a recommendation in this communication to the effect that a resolution be passed by our Association providing a warning on the label as to the use of wood alcohol and it is for you to decide whether you favor such a resolution. The communication itself would indicate it, and all that would be needed would be a motion that such a recommendation be approved by this section.

Mr. H. V. Army: I will make such a motion. But please read the label again.

The label was read as follows: "Poison, Wood Alcohol, Warning. It is unlawful to use this fluid in any article of food, beverage or medicinal or toilet preparation for human use, internal or external."

Mr. H. V. Army: Is that true?

Chairman Freericks: That is for you to decide upon and to give us the benefit of your judgment on one way or the other.

Mr. Louis Emanuel: I do not think it is true as far as toilet articles are concerned. I believe it is lawful to use wood alcohol in toilet preparations.

Chairman Freericks: It is undoubtedly used in some states.

Mr. W. L. Scoville: This question of the business propriety of selling wood alcohol in my experience is very much misunderstood. Dr. Reid Hunt a number of years ago went into a very thorough investigation while the question was in the air. No one knew whether wood alcohol was very much of a poison or not. To sum it up briefly, he made a rather remarkable discovery, namely, that wood alcohol in single doses is less poisonous than grain alcohol; in other words you take one dose of wood alcohol and you get less effect than you do from an equal dose of grain alcohol; but wood alcohol has a singular poisonous action that is altogether different. When you repeat wood alcohol in successive doses, say three or four times, then its action on the system is peculiar; it acts as an atrophic on the optic nerve; it gives way to that peculiar form of progressive poisoning that they cannot treat and cannot stop. You can take one dose, and then it will not do you any harm. Of course, if you take a large dose it might kill you, that is, speaking of wood alcohol. If you continue its use you get degenerative changes in the system that the doctors do not know how to treat. Men have lost their sight, some have lost their reason, and there is no way of stopping it. And there is the difficulty. They have found that even the vapors of wood alcohol, taken continuously or repeatedly, have a similar effect. Now, while I want to be on the safe side, it is generally considered that the use in toilet preparations is rather dangerous. It all depends on how your toilet preparation is used, how much of the vapor is taken in. There might be some danger and therefore I think the resolution is a wise one.

Dr. W. C. Anderson: We have a very stringent law in New York prohibiting the use of wood alcohol in toilet preparations or otherwise; no one in New York State can sell it.

Dr. O. F. Claus: I think we should always bear in mind the words, "Safety First."

Chairman Freericks: Do I understand that you make a motion to approve the use of the label? Dr. Claus made the motion and Mr. Packard seconded it.

Mr. George Lichthardt: I think the motion is unfortunate in calling it "wood alcohol," stating that that is the nature of it. I think that if the manufacturers had started out with some particular name, calling it by some other distinctive name and had omitted the name "Alcohol," that then we would not have had this trouble. The people think alcohol is absolutely harmless and they will buy it and use wood alcohol for outward application. I have had some trouble in my business in keeping them from using it. I know of cases where the application of wood alcohol or rather its absorption, has caused trouble and even serious accident.

I think it would be wise in a resolution of that kind to ask the manufacturer to apply another name and prohibit the use of the term "Wood Alcohol." We should have some distinctive name for it and make it the legal name and prohibit the using of the words "Wood Alcohol."

Chairman Freericks: Before you go any further I would like to say that I believe there is a slight misunderstanding regarding the resolution, or rather, I might say, the motion. The motion made by Dr. Claus was to receive the communication. There has as yet been no motion to approve that resolution as offered, and I therefore ask, do I understand now that Dr. Claus would make such a motion and Mr. Packard would second it? There is no specific resolution here. There is a recommendation which we can make the basis of a resolution.

Mr. E. L. Newcomb: The resolution should be contained in the motion.

Mr. H. V. Army: As I understand it we resolved to adopt a label similar to that.

Chairman Freericks: Exactly.

Mr. Louis Emanuel: I offer a substitute motion to that resolution eliminating the word "unlawful," because the label as so stated seems to be untruthful. For instance, while it might be truthful in Pennsylvania it would be untruthful in Ohio because Ohio strictly prohibits its use in toilet preparations.

Mr. J. C. Lloyd. We all know that this subject of wood alcohol has for many years been prominent in this country, wood alcohol being considered a poison. I remember at the meeting in Chicago it was sought to have adopted a resolution of that kind. An attempt was made to get some such name introduced, in order to introduce wood alcohol into pharmacy and the samples were there and I remember how energetically Mr. Ebert opposed the use of that until it was established as to whether it would carry with it the qualities of grain alcohol. Concerning the action of wood alcohol the Chairman will apprehend that we had in Cincinnati a few years ago a very pathetic case in which blindness resulted from the vapor of this alcohol. I know that at that time the attorneys on both sides kept the Lloyd Library busy trying to show whether it was or was not a poison, and I know personally from cases up on the Ohio River that it has been accepted pretty generally as being poisonous, especially where three ignorant people died from drinking wood alcohol as a beverage. And it seems to me that it is thoroughly established that wood alcohol under certain conditions is a poison and that even the vapor is a poison, as shown by its effect on the eyes of the unfortunate person in Cincinnati. Now, many persons cannot read. While I favor this resolution we all realize that

many people do not read, and many people do not see the label and do not read it, and I might say that I do not know whether it is proper or not. I cannot tell. But I think a label of that kind should be accompanied by a skull and cross bones.

Chairman Freericks: The suggestion comes that this Association adopt a label, somewhat like the label read, and that that should be approved by way of resolution. If there is no objection the Chair will take it that the suggestion made by Mr. Emanuel is satisfactory, for it is a point well taken, and that is that we leave out of the reading the word "unlawful" so it will read then, speaking of the warning "Poison—Wood Alcohol—Warning—it is Dangerous to use this fluid in any article of food, beverage or medicinal or toilet preparation for human use, internally or externally." That would make it read "it is dangerous to use this fluid." If that meets with the general approval, I want to put that as a separate motion. We will now take a vote upon the matter presented by Dr. Claus, with the understanding that we approve of a label similar to this, leaving out the word "unlawful." The motion having been regularly made and put, was declared carried.

Chairman Freericks: The report of the Committee on Chairman's Address is now in order. We are asking for this report at this time because the Chairman of that committee will be otherwise engaged this afternoon. I will ask Miss Cooper to take the chair.

#### REPORT OF COMMITTEE ON CHAIRMAN'S ADDRESS.

Your committee, to whom was referred the address of the chairman of the Section on Education and Legislation, begs to submit that the various subjects treated by the Chairman were given a most comprehensive form, and is indeed a marvel of its kind.

We concur with the Chairman that the American Pharmaceutical Association should, in no uncertain language, declare itself opposed to that regulation under the Harrison Act which prohibits the refilling of physicians' prescriptions which contain a minimum quantity of opiates and permits the sale of proprietary medicines containing said substances.

We thoroughly agree with the Chairman that the Association should give its unqualified endorsement to the Stevens-Price Maintenance Bill.

We believe with the Chairman that steps might be properly taken by this Association looking to the repeal of the tax on toilet articles, which now falls too largely on the retail pharmacist.

The marvelous success of the Section in interesting 44 State Boards and 42 State Associations in the framing of a modern pharmacy law, leads the committee to urge that the Council grant the \$100 asked for, to continue the work of the Voluntary Conference on a uniform and modern pharmacy law.

C. HERBERT PACKARD, Chairman,  
OTTO F. CLAUS.

Dr. Anderson: I would like to move that we take this report up seriatim, that is, act on each item as it comes up.

Miss Cooper: It has been moved that we act on these recommendations one at a time. Are there any remarks? If not those in favor of this will say aye. The motion was carried.

Mr. C. H. Packard: I just want to make a remark outside of the report. This report is a short one. In fact the committee did not hardly consider it necessary to put it in writing. It would seem almost like exceeding the vocabulary to enumerate the merits of the Chairman's address. You all know how much time and work he has given to the subject and the work the various members of our Association have put into this matter.

Dr. W. C. Anderson: One reason why I made the motion as I did in reference to this matter was so that we might be in a position to act upon it at this session. The report says, "We are opposed to that provision of the Harrison Act"—I do not think the Chairman's Address made any such statement as that. This is a regulation and not a provision of the Harrison Act. The Harrison Act does not provide that certain prescriptions shall be repeated and others not, concerning or containing certain properties, but the department has ruled this shall be the case and it is the ruling of the department we should oppose and I think we ought to make that clear.

Mr. H. V. Army: I second the motion.

Mr. Freericks: May I be permitted to say just a word? I want to make it clear. I desire to say that undoubtedly Dr. Anderson has understood the Chairman's Address quite clearly, and there is no provision, it is true, in the Harrison Act at all that would prohibit the refilling of prescriptions containing minimum quantities. It is a regulation of the Department. Of course, the Chairman in his address did not touch upon the matter of proprietary medicines in order to compare them, and did not seek to do that, nor intimating possibly that it would be all right to have such a regulation, if we also govern proprietary medicine. That is not the Chairman's view at all. The Chairman's view is, and I believe I may be privileged to state it at this time, that where proprietary medicines contain the minimum quantities there can be no exception to their sale, and that the same is true with prescriptions filled upon the order of a physician. The objection to which the Chairman's Address pointed is that the Department of Internal Revenue has undertaken to read something into the Harrison Act that is not there, and makes it now, under their ruling, unlawful for the pharmacist to fill prescriptions containing a minimum quantity. This is not only an absurdity but it is a gross injustice upon the American public who use medicines.

Dr. W. C. Anderson: I think that if that wording is simply corrected to state that it is the regulation of the Department instead of the provision of the Harrison Act, that we object to, that will cover it. I therefore move the adoption of the report of the committee.

The motion having been regularly made and seconded by Dr. Philip Asher, the Chair called for further remarks.

Mr. G. H. P. Liehthardt: The Internal Revenue Department of the United States has greatly and in fact gradually encroached upon the liberties of the American public. They have, in various ways constituted themselves judge and jury and fined people under various pretexts and there is practically no remedy, and I am very glad that such a resolution has come up, and that the Chairman of this Section has started the thing, and a little later on I wish to make a motion asking for an investigation of the basic principles of the Internal Revenue Department of the United States to see where we really do stand. As I understand it this government is a legislative government and Congress cannot legislate someone else to make crimes and punish crimes and therefore take the power away from the people.

The Chair: Are there any further remarks? Are you ready for the question?

It was moved that the report be adopted or rather approved. Carried.

Dr. Philip Asher: We thoroughly agree with the Chairman that the Association should give its unqualified endorsement to the Stevens Bill.

Dr. W. C. Anderson: I move that that section be adopted; seconded by Prof. J. U. Lloyd. Carried.

Whereupon the Chairman read in part as follows:

The Committee concurs in the recommendation of the Chairman concerning the repeal of the stamp tax on toilet articles.

It was moved by Dr. John Dawson and seconded by Mr. Buckma that the portion of the Committee's Report read be approved. Carried.

Thereupon, the next part of the Report asking that the Association appropriate \$100 was read and Dr. Philip Asher moved, seconded by Mr. H. V. Army, that it be approved, and upon motion, it was declared carried.

Dr. Philip Asher then moved that the report as a whole be adopted, which was seconded by Dr. W. C. Anderson. The motion having been put, on vote, the same was declared carried.

Chairman Freericks: There is just one matter before we adjourn the Session and that is the nomination for the officers for the coming year.

There has up to this time been nominated only one candidate for the office of chairman and one for the office of secretary. The nominee for chairman is your humble servant, who feels, truly feels, that the Section is entitled to a new chairman for the coming year and should have it. The other nominee is the one for secretary, Professor Kuever, who has been the nominee last year and who, as I say, has been again nominated to act this year. And I would therefore declare in order any further nominations for the office of chairman of the Section.

Prof. J. U. Lloyd: I hope, gentlemen, and young ladies, that you will put this on Freericks again. He has done so admirably and we are so proud of him in Cincinnati that I am sure Cincinnati will want him to stay in that place, and I hope the nominations will be declared closed and that Freericks will see fit to take that place.

Mr. C. H. Packard: I second the motion.

Miss Cooper, as chairman, then declared the nominations closed and Mr. Freericks was declared elected.

Mr. F. H. Freericks: I will say the Chair is somewhat doubtful as to whether such a motion is in order.

Mr. H. V. Army: You are not the chairman.

The Chair then put the motion, and the same having been regularly made and duly seconded, was declared carried.

Mr. Freericks resumed the chair.

Chairman Freericks: There are in order nominations for the Associate Chairmanship and further nominations for secretary. I desire to inform you, so that you may be fully informed, in fact, that further nominations will be in order now and the election is to be held at the afternoon and closing session and nominations will again be in order there. Are there any nominations forthcoming for the Associate Chairmanship of the Section? There are three to serve.

Dr. W. C. Anderson: I nominate Mr. Emanuel for the office of Associate Chairman.

Chairman Freericks: Mr. Louis Emanuel of Pittsburg has been nominated. Any further nominations.

Mr. Louis Emanuel: I nominate Miss Zada Cooper.

The nomination for Miss Zada M. Cooper for the office of Associate Chairman was seconded by Mr. C. H. Packard of Boston, and Dr. W. C. Anderson seconded the motion that the nominations be closed for this session.

Chairman Freericks: I will put the motion with the understanding that it is for this session. The motion has been made that the nominations for this session be closed. The motion having been regularly made and duly seconded, and the question put, the same was declared carried.

Chairman Freericks: Now, are there any further nominees for the office? Mr. R. A. Kuever, of Iowa, has been nominated at this time. Mr. Kuever has been acting as secretary last year. He has, unfortunately, not been able to be with us this year.

Dr. Anderson: What are the chances of his being with us next year?

Prof. Teeters: Professor Kuever will be with us next year. He regrets it very much, and desires me to tell you that it was absolutely impossible for him to be with you. That matter was decided at the last minute.

Dr. Anderson: I move that the nominations be closed for this session. Carried.

Chairman Freericks: A motion to adjourn until 2:15 is in order.

It was thereupon regularly moved and seconded, the question put, and the motion declared carried that an adjournment be had until 2:15.

---

## THE TEACHING OF MATERIA MEDICA IN MEDICAL COLLEGES.\*

---

EDMUND N. GATHERCOAL, PH. G.

---

A plea for the better training of the physician along the lines of Pharmacy and Materia Medica, leading toward an improvement in prescription writing, which is rapidly becoming a lost art. The Author refers to investigations of the prescriptions of today and bases his findings on an analysis of 10,000 consecutive prescriptions, collated in hundreds from different parts of the country.

From the pharmacist viewpoint, the education of the physician along the lines of pharmacy, materia medica and prescription writing has never been as complete and thorough as it should have been. It is evident, however, from a review of recent medical literature that among physicians themselves, concern has arisen over the tendency to eliminate or curtail these studies in the medical college curriculum.

It goes without saying, that the medical graduate should not be expected to be as thoroughly proficient in the details of pharmaceutical manipulation,

---

\*Presented as a part of the report of Committee on Drug Reform, L. E. Sayre, chairman and read before the Section on Education and Legislation, A. Ph. A., San Francisco meeting.

or informed upon the origin, description, constituents, etc., of drugs as is the educated pharmacist. However, the medical graduate who has first received a pharmaceutical education is at a great advantage over his fellows who have not had such an education. Between two and three percent of the graduates of colleges of pharmacy pursue medical courses and it is the common witness of these students that their pharmaceutical training is of great value to them, not only in their medical courses, but also in later practice. If the medical student received as much actual practice in prescription writing as the pharmaceutical student does in his prescription reading, the grade of proficiency shown by the physicians in this art would be much increased.

Some of the deficiencies shown by physicians in their prescription writing are well discussed by Dr. Bernard Fantus in a paper read before the Federation of State Medical Boards last year. He showed that 36 percent of 10,000 consecutive prescriptions collected in 100's from different parts of the country were written in English and 18 percent in poor Latin; this showing despite the almost universal teaching of medical Latin in colleges of medicine. His report further showed that though the metric system of weights and measures is very generally taught in medical schools it was used to but a very slight extent in prescription writing. Incompatibilities were present in about 2 percent of these prescriptions and overdoses or errors in about 1 percent of them.

To quote from Dr. Fantus: "After all, however, pharmacists do not see our worst failures in the teaching of prescription writing. I am convinced that a certain proportion of our graduates, on entering practice and finding themselves incompetent to write prescriptions, solve their problem by not writing prescriptions at all, dispensing their own remedies, with all the evil results of such practice.

"Summing up our findings, it becomes evident that there is need for considerable improvement in prescription writing. This could be secured if it were realized that prescription writing cannot be taught by lecturing or by demonstrations; that the students must be drilled in prescribing. I believe that the best results can be obtained, if a course on pharmacy and prescription writing be given before the work in pharmacology is taken up. The students should be made familiar, in this course, with the various classes of pharmaceutical preparations and their prescribing. Then, when the student enters his course in pharmacology, he is ready to write prescriptions for the remedies needed by the patients treated in the hospital and in the dispensary, and our students would leave our medical colleges well trained in prescribing."

In an admirable paper by Professor L. E. Sayre published in the *Journal of the American Pharmaceutical Association* last year a strong plea is made for the strengthening of the materia medica courses in medical schools. Professor Sayre says in part:

"As a matter of fact there are few who do not believe in drugs. The pharmacologist and clinician, working in their respective fields and, to a great extent, in co-operation, have contributed material to medical literature which justifies this faith in drugs. The instructor in materia medica (or systematic pharmacology) must be familiar with the result of these labors of the two branches of science and prepare his student so that when he is handed over for therapeutic and clinical work he shall be fully prepared to appropriate the results of

these researches and a thorough knowledge of the tools used in the treatment of disease."

"Herein lies the justification for the compulsory teaching of materia medica and the duty of the instructor and the entire medical faculty in seeing to it that its emphasis is not minimized."

The pharmaceutic and pharmacologic knowledge essential for competent prescription writing might be summarized as follows: The official Latin titles, abbreviations and doses of all the drugs, chemicals and preparations of the U. S. Pharmacopoeia; proficiency in the use of the tables of metric weights and measures; theoretical pharmacy regarding the galenical preparations and those for extemporaneous compounding; the active constituents of crude drugs with the relative therapeutic value of the active constituent to the crude drug itself; the relation of physiological action to chemical constitution; pharmaceutical, chemical and therapeutic incompatibilities.

Of course therapeutics, theoretical and practical, toxicology, medicine, etc., etc., are also essential and above all, as Dr. Fantus urges, a great deal of practice in actual prescription writing should be required of the medical student, for after all practice makes perfect.

#### ABSTRACT OF DISCUSSION.

Mr. F. G. Binz: That is a very able paper. I think it is a subject that bears close investigation and one that will strike at the nucleus of all the trouble between the pharmacist and the present practitioner.

It is a course that should have been inaugurated in the curriculum of medical schools in years past; and there is absolutely no question that if the medical schools will take up this course and follow it out carefully that it will materially improve the practice of pharmacy.

Dr. W. C. Anderson: It might be of service to some of the members who take an active part in propaganda work with the physician to know that in New York City a few years ago when we were inaugurating our propaganda work, holding meetings with physicians was found to be successful. We still continue those meetings and recently the question of teaching materia medica and prescription writing came up for discussion and we suggested that work should be done just along the lines of this paper.

The heads of the medical schools said to us: "It is a good suggestion, we realize the need for it but we cannot do it, our curriculum is full. We have all the material we can now possibly put into our teaching in the time allowed without increasing the course to a great extent. We cannot take up this work as you suggest."

We then asked them whether they had studied their curriculum carefully in an endeavor to see if there was anything in it that they could cut out so that this very important subject might be added. Perhaps I neglected to say that the conversation I referred to took place between one of the heads of the Bellevue Hospital in New York and our members. Well, the doctor at Bellevue College said he thought that was a good suggestion and he would look over it. When Dr. LeChevre came to our next propaganda meeting, the meeting of physicians and pharmacists, he said that our suggestion had appealed to them, that they had looked over their curriculum and they found that they were using a number of hours each week in teaching the physicians how to make emulsions and pills and suppositories, that we might say were absolutely unnecessary to be taught in medical colleges. We find examples of that condition in most of the medical colleges of the country, which merely take up time, which could be utilized in the teaching of therapeutics and prescription writing. And I might say that they (the Bellevue) immediately changed their course and introduced the splendid one along the lines suggested by this paper, so much so that they provided subjects out of the United States Pharmacopoeia and National Formulary. That is what is done by propaganda work, and I call attention to it in the belief that it might be of some service to others who work along this line with physicians. I believe that we

can go on year after year preaching co-operation and asking the physicians to prescribe more drugs in an ethical way, but without results. We cannot get results until the student in the college is taught the proper writing of prescriptions, and he is placed in a position where he has confidence in himself when he diagnoses a case that he can write out the prescription which can be compounded properly by the professional pharmacist.

Dr. Philip Asher: I have not heard all the paper but I believe I have heard sufficient to allow me to discuss a feature that has not come up along the line of what Prof. Anderson said. He stated that he felt that the curriculum of the medical college could be enhanced by teaching materia medica along proper lines. But there is one place where the physician can be educated and at the same time allow the pharmacist to be a source of help and education and that is the hospital apothecary. In all large hospitals the apothecary is the one to do more good towards propaganda work than anyone else. I do not know whether it would be in keeping with this paper to offer a resolution that would empower or place the apothecary in a position to teach the proper work along these lines. If the hospital apothecary would assist in the instruction of the young doctor along these lines I believe it would do more good than anything else. If the young physician is taught properly by the apothecary we will be working along better lines and it will give the apothecary a great deal more love for his work, he will know that he is doing something, in fact doing more in this line than anyone else. Take the pharmacist at large. When a young doctor starts to practice medicine he makes friends with the pharmacist, but sooner or later he drifts away. If he is properly instructed at the time he is taught medicine, I think it will really give us a very good and lasting foundation.

Dr. O. F. Claus: The same course that Dr. Anderson spoke of was pursued in St. Louis by the Retail Druggists' Association and the question was taken up with members of the medical society, and also the colleges. I am pleased to say that two of the colleges are teaching prescription writing. It is not only a great help to the young doctors but it is indeed a big help to the druggists of St. Louis.

Chairman Freericks: Would it be impossible altogether to seek to teach the medical student in the colleges of pharmacy, to interest them in some manner to give courses in pharmacy. Is that so altogether impossible? It is a question that has often arisen in my mind, and if there is anyone who can possibly have anything to say on that feature it might be helpful.

Professor E. L. Newcomb: In that connection I want to say that in our prospectus we make provision for such teaching. We have been in existence fifteen years and no student has availed himself of the opportunity. I have heard medical students say they do not get enough of pharmacy, that there are certain things they would like to know about it, but they cannot spare the time for the study. Medical students in our school are required to take a certain amount of pharmacy in the college.

Mrs. R. A. White: There is only this feature about it: if you introduce these medical students into all the intricacies of manufacturing our wares, putting up our prescriptions and so forth you will be surely making them dispensing physicians. Physicians should know how to write a correct prescription, but to really give them a course in pharmacy seems to me impossible. This would prepare the way for more dispensing physicians.

Professor H. V. Army: I might say that the question of teaching materia medica in the medical schools has very considerably improved in the last ten years. I recall one case of a man who went to a medical school and found when he got there that they were teaching in the medical school a much better course than they were in the pharmacy school. He found that the pharmaceutical laboratory course provided for more hours than they averaged in the regular college of pharmacy. The man who has charge of the department is an ex-druggist, and he is desirous of bringing about a reform, and the reform is exactly along the line mentioned in this paper by Professor Gathercoal. The object is this: He keeps before the student preparations of the U. S. Pharmacopoeia and the National Formulary and the German pharmaceutical preparations. The student starts in with the material itself, and then he has the labeling to do, and the inscription of the label to write, he takes into consideration the writing of the prescriptions, and he is given certain tests,

and is compelled to write prescriptions and they are marked. If all medical schools were handled in that way, by the time the students graduated they would know something about prescription writing.

Mr. W. F. Root. I take it that the paper refers to the application, rather than to the work of a pharmacist. I do not think that the paper refers to the educating of a physician to make preparations but rather to know the ingredients, the *materia medica*. To my mind, the real doctor is developed from the man who started in as a druggist, who then goes to a college of pharmacy and later to a medical school.

Mr. Phillips: I think that sometimes we try to get too much into the college course. Pharmacists should use their efforts with the young physician when he first begins to practice and help him in his prescription writing, otherwise the detail man will get hold of him and show him the easy way to prescribe so that he becomes lost for a long time. I also think that the bringing together of physicians and pharmacists through the colleges, through the alumni, is really higher education.

---

### MORE ENGLISH FOR THE PHARMACIST.\*

---

CHARLES P. VALENTINE.

---

The tendency of pharmacy today, is toward the elevation of educational requirements for those who enter it. Many examining boards of pharmacy require that its applicants be graduates from a recognized college of pharmacy; the latter, in turn, are gradually, and wisely, demanding higher entrance requirements, and are lengthening the various courses they maintain. A number of our leading colleges of pharmacy are departments of the larger universities; their students receive collegiate training in chemistry, botany, and biology, along with that in the strictly pharmaceutical subjects, and yet the students in pharmacy are the only university students who are not required to take, nor do they receive, at least the first year's course in college English, during their attendance. If the student in law, in engineering, in commerce and accounting, in chemistry, or in a liberal arts or academic course, is given a course in college English, why should not the student in pharmacy, in the collegiate course, receive the same?

As yet the matter has received but little attention, and less recognition on the part of the schools of pharmacy. The American Conference of Pharmaceutical Faculties, it is true has prescribed a year of high school English for the schools complying with its standards for pharmaceutical educational requirements. Many colleges of pharmacy include college English as a requisite in their three and four years courses in pharmacy. This is, however, at present of little significance, since the great majority of students in pharmacy elect the two year course only.

The value and importance of English to the pharmacist must become apparent upon the analysis of the demands his calling makes upon him. The pharmacist of today is not only the professional man; to be successful he should be an intelligent, carefully trained and versatile business man as well. Peculiar then, in that pharmacy combines the advantages as well as the difficulties of both a professional and a business career, it appears that the college of pharmacy

---

\* Presented to Section on Education at I. L. C. Union, A. P. A., San Francisco meeting.

should strive to combine those college subjects which make for a practical as well as theoretical maximum of educational efficiency in its students. Among those subjects, not strictly technical, college English as a required course in pharmacy, would be of immense value and benefit.

English, in its broadest sense, implies the correct use of our language, in oral as well as written discourse, and in expression of thought. Matters of good usage, grammar, spelling, punctuation, paragraphing, manuscript arrangement, and letter writing, are hence essentials of paramount importance. To indicate the value of correct English in daily conversation, and as an aid to individuality and power in self-expression, seems superfluous in that it applies to the pharmacist no less than any and every individual.

To the pharmacist English means this and more: consider if you will, his business correspondence and letter writing, salesmanship, and show card writing. Would not college English prove of inestimable aid and value in these specific examples of the young pharmacist's necessary qualifications? Efficient salesmanship and advertising is the very life of any successful enterprise, be it pharmacy or any other profession or business. And what other than English is the foundation upon which these modified forms of expression depend?

On concluding, consider the pharmacist apart from his calling—as a citizen and a member of the community in which he lives. He, too, should cultivate interests outside of his art. He should, no less than his fellow professional and business men, be broad minded, and make his profession incidental to his being a good citizen. A college training should help make him so, and of those few not strictly pharmaceutical subjects permissible in an already congested course, college English deserves, above all others, a place in the course of our schools of pharmacy.

---

#### EXAMINATION OF FLUID EXTRACT OF CONDURANGO AND OF CONDURANGO BARK.

The German Pharmacopœia requires that when a mixture of 1 cc. (mil) of fluid extract of condurango and 4 cc. (mils) of water are heated to boiling, the liquid should become very turbid, but that the turbidity should disappear again on cooling. Two cubic centimeters (mils) of the cooled solution mixed with 8 cc. (mils) of water should yield a copious precipitate on the addition of tannic acid solution. Richter (*Apoth. Zcit.*) has utilized these reactions for determining the quality of both the fluid extract of condurango and of the bark. Four cubic centimeters (mils) of the boiled and subsequently cooled liquid are mixed with 16 cc. (mils) of water and 2 cc. (mils) of a 5 per cent. tannic acid solution. The precipitate is then allowed to separate and in the liquid 6.5 grammes of finely powdered sodium chloride are dissolved by gentle shaking. The mixture is then carefully transferred to a burette, and the quantity of precipitate is noticed, removing any foam by the addition of a few drops of alcohol. A good fluid extract of condurango should yield when examined by this method about 5 cc. (mils) of precipitate. For examining the bark, 50 grammes of the latter are macerated with 50 grammes of water for 4 hours. The mixture is filtered, the filtrate boiled and cooled again and 4 cc. (mils) of the cold liquid are treated as given above. The precipitate thus produced should measure from 5 to 6 cc. (mils).—*Through Druggists Circular.*

## Papers Presented to the Joint Session of the Section on Education and Legislation, A. C. P. F. and N. A. B. P.

### QUALIFICATION REQUIREMENTS FOR TEACHERS IN COLLEGES OF PHARMACY.\*

WILLIAM C. ALPERS, SC. D.

The question, "Who is a Professor?" was brought to my notice during the last year at three different occasions. The first was a letter received from Dr. H. H. Rusby, in which he asked my opinion on the proper salaries of professors in schools of pharmacy. He had been appointed the chairman of a committee to gather facts on this point and report at the next meeting of the Conference of Faculties. When I tried to answer him, the thought naturally arose in my mind, what does he, or his committee, understand by a Professor? Is it a man who devotes his whole time, his whole life to pharmaceutical education, or is it a man who has all kinds of commercial interests, rushes to the school a couple of times a week, pulls out a manuscript, reads off a number of pages, and goes back to his work that he considers the object of his life?

The second occasion that brought this question to my mind was a letter received from a friend who is a member of the Board of Trustees of a certain college. On this Board, he is one of the few who advocate higher preliminary education, while the majority are opposed to it. In a discussion of this question, one of the Trustees closed his argument by saying: "All this talk about high school education for our students is nonsense, as long as our professors themselves have no such education."

The third occasion is the fact, well known to those who teach in schools of pharmacy that are connected with universities, that the pharmaceutical professors are often looked upon as an inferior class, not equal to the others, and simply tolerated. This fact was brought home to me at various occasions during the last year.

The main object of the joint meetings of the Conference of Faculties and members of Boards of Pharmacy is, without doubt, the desire and the hope to raise pharmaceutical education to the same standard as that of other professions; to have the same recognition for the teachers as well as the schools, and to gain equal respect for all members of our colleges. Dr. Albert Schneider, the former President of the Conference, in his annual message, pointed out in very terse words why the Conference has failed in many points, and why the progress made is remarkably slow and small. It is timidity that blocks the way. It is the fear of offending each other. It is the dread, natural to every man of education, of hurting his neighbor's feelings. While this tendency may be justified to some

\*Read before the Joint Session of the Section on Education and Legislation, Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy, held at San Francisco, August 11, 1915.

extent, and is in most cases traceable to a certain courtesy or gentleness, it is yet out of place in a movement for progressive reform, in an enterprise with a distinct aim and well-defined purpose; in an undertaking where frankness and courage must be the leading qualities. It must be understood that such a reform must be a reform for the future; that no measures adopted can be intended to have retroactive force, and that under no conditions should personal feeling or prejudice enter into the discussion. Nor should those who believe in conservatism indulge in obstinacy. The claim that we got along very well so far, and can get along just as well in the future; the argument that because our forefathers did not have a certain thing we do not need it, should not even be thought of. If such talk is of any value, there will be no progress of any kind. It is simply the argument of the stupid longshoremen who tried to destroy Fulton's first steamboat, because such a devilish invention would take their bread away. We must therefore look into the future. We must depict before our eyes a nobler and higher temple of pharmacy, built on a foundation of knowledge, education, truth and enlightenment, and must go to work with all our efforts until this noble structure is erected.

Let us, therefore, see who, in an acknowledged higher institution of learning, is called a Professor. Columbia University of New York, as well as the universities of Harvard, Yale and Princeton, have the following custom: The young man who wishes to enter the academic career is first employed as an *Instructor*, with a yearly salary of \$1200. He receives an increase of \$100 per year until \$1600 is reached. At the discretion and pleasure of the Trustees, he is then appointed *Assistant Professor*, with a salary of \$2000, with a yearly raise of \$100 until \$2600 is reached. At the pleasure of the Trustees he may be appointed *Associate Professor*, with a salary of \$3000, with a yearly raise of \$100 until \$3600 is reached, and then receive the appointment of *Professor*, with a salary fixed by the Trustees.

You will notice that it says: 'he may be appointed' in each case, provided there is a vacancy and his services have been of such a nature as to make their continuance desirable. This system does not exclude that a particularly able man may be advanced, in one or two years, from the position of Instructor to Assistant Professor, and so on. No young man is employed, however, as Instructor unless he has an academic degree; that is to say, a degree for which he has worked, and which was conferred by an institution of equal standing; not an honorary degree, or a self-conferred degree, such as unfortunately there are quite a number in pharmacy. This rule, however, does not exclude to call a particularly able man to a professorship without reference to his former position, although cases of this kind are very rare.

In these universities it is supposed that the professor devotes his whole time to his work, and any outside occupation that would require his absence from the college for a number of hours every day, is not allowed. This same system prevails in many other universities in the West, although it may vary in the number of years of service and the height of salary. But the underlying principle is adhered to in every first-class university, and no university can join the Conference of Faculties until the system of appointment of professors has been passed upon.

These rules, adopted several years ago by the leading universities, do not refer

to men that were appointed before their adoption, under different conditions. It is evident that by such a system only able and earnest men will reach the goal of their life. It is clear that this system will create an atmosphere of education, learning and enlightenment throughout the halls of the university, and that the students will constantly see before them their superiors in knowledge and devotion.

Can such a system be applied to pharmacy? A number of the members of the Conference, particularly those whose schools are connected with state universities, will quietly reply that it has been applied for years in their schools. But these cases are not the rule. In a great many schools there is neither order nor system in this respect. In fact, there are Trustees who believe that a man with an academic degree thereby becomes unfit to teach. The question, however, is a very important one and should be considered and argued in the utmost frankness and earnestness. It seems to be wrong to judge and register a school of pharmacy solely by the pre-requisite requirements for the students. A school consists of teachers as well as students, and if reforms are recognized to be necessary, they should be made throughout.

I am fully aware that an academic degree, as such, does not make a man a good teacher and should never be the sole criterion of a man's ability. But if we deny the necessity of establishing some kind of a standard for the future professor in pharmacy, why are we so anxious to uphold such a standard for students and licentiates? A certificate from a high school, as such, does not necessarily make a good student. A diploma from a school of pharmacy does not necessarily make a good prescription man; and a license from the Board of Pharmacy is no guarantee that the holder will make a good proprietor. But we require all these credentials as a certain safeguard for the public against ignorance and impositions; and in the same way we should establish a standard for the future teacher as a safeguard for the students.

The desire for a higher education in all professional lines is not a local one, nor is it a passing wave of excitement. It is rather a firm conviction, based on long and careful observations of well meaning and thoughtful men that the time has arrived for a forward movement in this respect; a movement that extends through the whole country from one end to the other. It is, therefore, not only desirable, but it is our plain duty that we should approach this question with sincerity and earnestness; that we should discuss it in all its phases, arrive at a uniform result, and lay out a clearly defined way for future action. If we fail to do this, the legislatures of the different states or the national government will soon interfere. In fact, in some states they have done so already, in a tentative way. I, therefore, recommend this question to your earnest consideration.

## A PHARMACEUTICAL APPRENTICESHIP IN AMERICA FIFTY YEARS AGO.

---

JOHN URI LLOYD, PHAR. M.

---

The Chairman of the Educational Section of the American Pharmaceutical Association, Mr. Frank H. Freericks, has asked me to record for this meeting my experiences, fifty years ago, as an apprentice in pharmacy. I think that all will agree that a paper such as this, being necessarily personal, should be written in narrative form, and in the first person.

I cannot recall when, from my earliest years, I did not know that I was destined to be a druggist. Whether this decision on the part of my parents was made from observation of my natural bent, or whether I followed, as intelligently as I could, a path that seemed to them most advantageous in those days, I cannot tell. But events, even before my birth, were such as naturally to indicate that this should be my chosen life work.

My father's profession of Civil Engineer, in which, in "York State," he had achieved considerable success, brought him, in 1853 into Kentucky as Surveyor of a railroad to be lined from Covington to Louisville. Bringing his family to Kentucky he located, temporarily, near the line of survey, in Burlington, Boone County. Unsettled financial and political conditions brought the railroad to a standstill, and my father and mother, (a Webster, of the Massachusetts Websters), opened a school which became, practically, a cosmopolitan educational institution. We always had, as "boarders," children from distant sections of Kentucky, and for the conduct of such a school I may say, in passing, my parents were unusually well qualified. Both were highly educated, and both had, in their Eastern home, been very successful teachers. Col. Henry S. Dean, an ex-Regent of Michigan University, now living in Ann Arbor, as a boy of fourteen attended the Academy of West Bloomfield, N. Y., of which my father was the Principal. Of him, Col. Dean says:

"I have always remembered Mr. Lloyd, (father of John Uri), with a great deal of affection, for I think he did more for me, as a boy, than any other teacher I ever had. He had a way of impressing things upon a boy that other teachers did not have. He did all the correcting in a school of several hundred, but he did not use corporal punishment. His methods of disciplining were very original, and very effective. On Saturday afternoons he was accustomed to lecture to the pupils, usually on some scientific subject of interest, and while attendance at these lectures was voluntary, they were so interesting that the pupils all wanted to attend. One of his most severe punishments for misbehavior during the week, was the loss of the privilege of being present at the Saturday afternoon lecture, so that it became a common thing in the village, when a boy or a girl was seen on the street during the time of the lecture to ask, 'What have you been doing this week? What rules have you been breaking?' I was in his school for a year, and never, in all my school days, did I have another teacher whom all the pupils loved, as they did Mr. Lloyd. They seemed to have all confidence in him. He believed in

fair play, which is a very necessary thing in dealing with a boy."—By Margaret Stewart, Secretary of John Uri Lloyd.

Rearing three boys and fitting them for a life work under the rather primitive conditions then prevailing in our section of Kentucky was no easy accomplishment, but the constant effort of my parents was in the line of inculcating in those under their charge, ethical ideals of future citizenship and usefulness in life. Our home training was ever in the line of impressing upon us useful lessons, and even at the table, conversation was of a kind to lead a youthful mind to quick and accurate judgment concerning topics of importance.

My apprenticeship in pharmacy may thus be said to have begun in my home years, for even when I was too young to be properly enrolled in the class in chemistry in the school, my interest in that subject was such that, when the class was reciting, I had thought for nothing else, and at home I was guided into home experiments, in which such exhibition substances as oxygen, hydrogen, etc., were made conspicuously entertaining. I of course had no apparatus, such as glass tubes or retorts, but the very lack of such appliances led me to exercise ingenuity in finding something to take their place. I well remember how connected stems of the pumpkin vine were made to furnish a delivery tube for gases generated in an old-fashioned, conical ink bottle, to a pneumatic trough improvised from my mother's dish pan, a pumpkin stem that curved naturally, forming the bend over its edge, my mother's quart camphor bottle being borrowed, (surreptitiously), to collect the gases generated in my back-yard laboratory.\*

Another influence in my early life, that had a deep influence upon my later course of action, was the fact that both my parents were tinctured with the Thomsonian doctrines of New York and New England, and through bitter personal experience, were antagonistic to bleeding, salivation and like processes. Myself a sufferer for years in early childhood from asthma, which resisted all treatment from the doctors, an appeal for help was made for the home treatment commended in New York, and my first relief from the affliction was obtained from the Lobelia Pills made by my grandfather Lloyd, on his kitchen table in North Bloomfield, New York, after the Thomsonian formula. This, doubtless, had its influence in later years, when it became necessary for me to choose between pharmacy according to regular methods, and pharmacy as applied to the minority school.

When I reached the age of fourteen, my parents decided that the time had arrived when I should make an active beginning in pharmacy proper. They were united in the opinion that *thoroughness in preliminary work*, directly designed to fit one for a life vocation, was the first essential for success, and although they did not underrate the value of a college education and were in a financial position to send me to college, they feared that if my school education were made the first requisite, I would not be willing to begin at the bottom in pharmacy, a thing they believed to be essential in the training of a pharmacist, and that I would thus be

---

\* All this is recorded in my extemporaneous remarks at the Boston meeting, 1912. My old "Comstock's Chemistry," and my "Fownes' Chemistry," now on the shelves of the Lloyd Library, may be considered as the foundation stones of that Library.

diverted from my life work. Though highly educated themselves, they felt that such opportunities as came from schools could be better accomplished after I had grounded myself in the preliminary work of the pharmacist.\*

*Seeking a Situation.*—The winter of 1863-4, my father was teaching in Florence, Kentucky.† I was then too young, too inexperienced, and I will add, too "green," to be permitted to go alone to the city to look for work. After the decision that I must now begin my apprenticeship, every Saturday morning, (vacation day), my father and I would start to Cincinnati in the local milk wagon, the only passenger conveyance to the city. Leaving home at 4 a. m., we would wander about the city until the drug stores began to open. Then, going from one to another, my father would ask, "Do you need a boy?" Constant disappointment followed until, one day, Mr. W. J. M. Gordon, at the corner of Eighth Street and Central Avenue, (then "*Western Row*"), much to my delight, answered, "Yes." My father and he together made the arrangements for my apprenticeship, I an eager, much interested listener. The arrangement was as follows:

I was "bound" for two years, to an apprenticeship to "learn pharmacy," beginning, as both expressed it, "at the bottom," which I soon found to mean, literally, *at the bottom*. My day was to begin at seven o'clock in the morning, when I was to be at the Post Office to get the mail and take it to the store. Every morning I was to sweep the store, clean up the soda counter, wash all the glasses, wash the bottles for the prescription counter and case, clean the graduates and mortars used in compounding prescriptions, once a week wash all the windows, run of errands as necessity required, fill the soda syrups and wait on the soda counter, and at odd times, put in my time filling and folding Seidlitz Powders. For performing these duties, I was to receive \$2.00 a week the first six months, \$2.50 the next six months, \$3.00 the third six months, and \$4.00 the remaining six months.

Of the several boys in that establishment, I was the only one thus apprenticed. The others were simply employed, and received much higher pay than came to me, their object being only the usual returns that come from business. We boys could not agree in that my small pay did not result from my inferiority, a phase of the question that was to me somewhat humiliating. Then, too, I came from Kentucky while yet "the war" was in progress, when one coming from Kentucky into Cincinnati was demerited. Again, my dress at the beginning of my apprenticeship was not in accord with that of the other boys in the store. Among other things, I recall that in my section of Kentucky, it was customary for both men and boys to wear shawls in cold weather, and also in the rain. The shawl with which I came prepared, was a gray, heavy, country-made woolen shawl. Altogether it was a good protection from the cold and rain, but to my surprise, the boys of the establishment made this shawl, of which I thought much, the occasion for side remarks that were not very pleasant to me, and once, at the very begin-

---

\* Dr. T. L. A. Greve, that accomplished Cincinnati pharmacist, often discussed with me this phase of pharmaceutical education. He fully agreed that my parents took the proper view of the problem.

†Known as "Stringtown," in my folk-lore studies of Northern Kentucky.

ning of my apprenticeship, when one day I started down town on an errand, Mr. Gordon suggested that it was not cold enough for a shawl! Looking back, I can see that he naturally felt a pride in his establishment, and felt that an apprentice boy wearing a shawl, was not exactly in good form.

As we left the store of Mr. Gordon that first morning, after the terms on which I was to enter had been settled, my father's parting remark was, "Mr. Gordon, be sure to see to it that whatever Johnnie attempts to do, he does right! If he does anything wrong, see that the work is done, over and over, *until it is right*." These words Mr. Gordon never forgot, as I learned from sad experience during the two following years. Many a window did I repolish as Mr. Gordon would say, "Remember what your father said. Do that again."

On our way home that day, my father stopped before a fruit stand at the corner of Fifth and Elm, on which were displayed the first bananas I ever saw. Pointing to them he said, "Johnnie, you must learn to deny yourself such as these. You must learn to pass, and not stop. The boy who cannot deny himself pleasures when young, will probably not have the chance to do so, when old. You are here to learn the drug business. This city has many attractions for a boy, other than fruit. Be very careful to make no bad companions. Do not go anywhere you would not like your mother to know about." That I profited by these suggestions, at least in part, is evidenced by the fact that for two years I passed that fruit stand daily, and never once did I stop.\*

An attic room in a cheap boarding house, 199 East Third Street, eight blocks from the store, was secured for me. Here I lived during my first year, and was then taken to room and board with Mr. Gordon's head Prescription Clerk, Mr. Riefsnider, in the home of professor E. B. Stevens, Dean of the Miami Medical College, and Editor of the *Lancet and Observer*. As I look back, I see that this arrangement was not by chance, but that every effort was being made, by all concerned, to fulfill the arrangement made with my father. My duties seemed to be onerous and the hours were long, beginning at seven in the morning, and the first six months extending to nine at night, when, so tired was I that I could scarcely drag my feet to my attic room on Third Street. Every third Sunday I was allowed the day off, for the purpose of visiting my home in Kentucky. On these weeks, I was permitted to leave the store Saturday afternoon at three o'clock, and there being no regular conveyance at that hour, I usually walked to my home, ten miles back of Covington. Very often I walked back again Monday morning, in time for business. Often I lugged a carpet sack, carrying my clothes, which were washed and mended at home.

Most exacting was Mr. Gordon, and Mr. Riefsnider was not less so. No one spared pains in teaching me the "rudiments of pharmacy," but sometimes I felt that my duties, such as scrubbing the floor and washing the windows, were far from the drug business. My work was hard, but I made no complaint, and at the end of my first six months was highly elated when my salary was raised to \$3.00 per week, instead of the \$2.50 agreed upon.

One by one, opportunities were given me to learn the "business." Very awk-

---

\* Bananas at that time sold for ten cents each, or two for fifteen cents. Not for two years did I indulge in the luxury of a banana!

ward was I to begin with, but very observing, and I flatter myself, rather expert at learning, and I quickly fell into the processes that at that time marked the beginning of an apprenticeship in pharmacy. The charging of the "Soda Fountain" became early a part of my duties. As I revert to this experience, I comprehend the danger I ran, from the complicated copper apparatus used to generate the gas, by means of "marble dust" and sulphuric acid. The pressure was eighty pounds, and the apparatus not new, but with the audacity of inexperience, I daily went through the process.

In the line of real pharmacy came, after some months, first, the reading of prescriptions, and the learning of the tables of weights and measures, with their uses. Standing by the side of the head clerk when he filled prescriptions, I watched him make the compounds, and had the reasons for the various mixtures explained to me. At last I was permitted to make the measurements for simple prescriptions, such as a mixture of Syrup of Squills with Syrup of Ipecac, and pour the mixture into the bottle, whilst Mr. Riefsnider watched the process, wrote the label, and numbered the prescription. I was drilled in the rolling of pills and in the selection of excipients, in the making of the medicinal syrups then in use, and in the beginning of pharmacy, as pharmacy was then practiced. That was the day of heroic medication. The spreading of plasters was continuous, and that process I soon learned. I would give much, now, for the old "Plaster Iron" I so frequently used in making the "Strengthening Plasters," "Diachylon Plasters," and above all, "Blistering Plasters," (Cantharides), to fit different parts of the body, such as the back of the neck, or behind the ears, all these being with us, constant necessities. In these rudiments, by reason of the help and advice continually given me by my preceptors, I soon became proficient, and when my two years of apprenticeship had passed, I found myself capable, in the absence of other clerks, of waiting upon the front store, and of "selling" simples, such as "senna and manna," epsom salts, and other remedies called for over the counter, and even of compounding simple prescriptions, where there was no question as to my understanding the same. By this time I had learned to make emulsions, to compound pills by means of the best excipients, to make suppositories with paper cones, in the old-fashioned way. In fact, I was fairly proficient, for an apprentice of two years' experience. I was also taught that I must become conversant with the natures of drugs, and especially of the poisons. I was taught, verbally, the qualities of the different agents, and I put in all my spare time, (none too abundant), in reading the Dispensatory. My chief opportunity for study came on Sunday, for on that day no business was permitted in Mr. Gordon's establishment, other than the compounding of prescriptions and the dispensing of legitimate medicines. No toilet articles were sold; no soaps, no soda drinks, nothing outside of medicine, formed a part of our Sunday business.

The time of my apprenticeship was much enlivened by almost daily encounters with the other boys and the under clerks. The fact that I was country bred did not escape their notice, and they took their own methods of initiating me into city ways. Once, in the absence of Mr. Riefsnider, who would not have tolerated such a process, one of the clerks sent me with an empty graduate to the hardware store two squares down on Central Avenue, for a pint of vinegar. As I returned

with the empty graduate through the front store where Mr. Gordon sat at his desk, he said, "Where have you been, Johnnie?" I replied, "To the hardware store, for vinegar." Said he, "They do not carry vinegar in the hardware store, here." Said I, "Where I was raised, every store carries everything, and when I was told to go to the hardware store for a pint of vinegar, I thought that was the place to go." Mr. Gordon smiled, and said nothing more.

In those days, all the employes were given the privilege, the middle of each morning, of a glass of soda. I was accustomed to suck my glass of lemon soda through a glass tube. One morning, when I placed this in my mouth, I found it coated with sulphate of quinine. Apparently not noticing anything wrong, I drank the bitter draught, and that joke failed.

It may be asked, "What has such as this to do with an apprenticeship in pharmacy?" Let me reply by saying that no incidents connected with my apprenticeship stand more conspicuous in my memory. I recall especially one boy, much larger and stronger than myself, who took particular pains to annoy and persecute me. I was undersized, rather feeble, and physically not his equal, as I found by experience. This having been settled, he should have known that, on honor, he was then bound to let me alone. In Kentucky, the boy who fought and was fairly whipped, was to be protected against such a bully as he. I dared him to go down into Kentucky, where I could beat him with the rifle, if I was not his equal with the fist, and I told him that until he dared face me fairly with a gun, I considered him a coward. I would give much to learn what has become of that boy, and what kind of a man he made of himself.

Gradually, as the days passed, the *drilling* that I got in different directions, interspersed with an occasional fight, made me self-reliant, as well as good-naturedly antagonistic, and before my two years of apprenticeship had passed, I had learned to take my own part, while in the things that should be learned, I was equal to any of the junior clerks. The lessons I learned were, in after life, invaluable to me. Thrown upon my own resources, almost an ostracised human being by reason of my Kentucky home and country dress and manners, I was made to take care of myself in the face of resistance such as comes to few.

*My Second Apprenticeship.*— But as yet I was not a *druggist*. Appreciating this fact, with Mr. Gordon's consent I apprenticed myself a second time to Mr. George Eger, an accomplished German pharmacist at the elbow of the canal, opposite the "Mohawk Bridge." At that date in Cincinnati, a drug clerk, to be proficient, needed to understand the German prescription business. With Mr. Eger I began over again, *from the very beginning*, for in Mr. Eger's opinion I had not as yet advanced very far in pharmacy. During the entire time of this second apprenticeship, my salary was three dollars per week, and board, for I had the privilege of boarding with the family of Mr. Eger, who occupied rooms over the store. Again it became my duty to wash the windows, graduates and mortars, and once a week to scrub the front store, a duty which was occasionally enlarged to the scrubbing of the kitchen, which thus became a part of my pharmaceutical duties. With Mr. Eger I had the same opportunity as with Mr. Gordon of visiting home every third Sunday, and in addition to this, I had the privilege of attending Professor Robert's Bartholow's lectures on chemistry at the Ohio Medical Col-

lege. These Mr. Eger felt were to me a necessity, and to his care in this direction I owe much.

With Mr. Eger, I was especially to be taught prescription pharmacy. He taught me not only the natures of the different drugs, but their doses and actions. He himself was extremely particular in this direction, and never did he fill a prescription till he was sure that the dosage was correct. In case he was not sure, he looked it up in the authorities then used, and I once saw him spend an entire hour hunting up the dosage of some obscure substance. After I myself began filling prescriptions under his care, he enforced upon me the same rule, and I was required not only to know the dosage of each remedy mentioned in a prescription, but the amount that would be an overdose. It was then the custom, among German physicians, in writing a prescription that carried a substance in what was, under ordinary circumstances, an overdose, to place above the prescription the "square root" sign, thus certifying to the fact that the prescription stood as it was meant to be.

As an apprentice with Mr. Eger I studied each night, beginning at eight o'clock, the Dispensatory record of some drug selected by him. The next night I wrote from memory a description of that drug, including its origin and history, its uses and doses, and if a poison, its antidote. The next evening he would review what I had written the previous night, criticising and correcting it, emphasizing oversights. Then another drug was named, to be studied in like manner. With Mr. Eger I learned every detail possible in the handling of medicines, the compounding of prescriptions, the making of tinctures and syrups, and the powdering in an iron mortar and sifting of crude drugs, for in those days we powdered our own drugs. All this I was forced, or I might say, was permitted to learn, in this second most exacting apprenticeship, embracing, in the aggregate, practically everything that came in the direction of pharmacy in Cincinnati. At the end of this period, Mr. Eger informed me that he considered me competent to engage anywhere as a prescription clerk, and indeed I would have been dull, could he not thus have expressed himself. He was accomplished in languages, science, medicine and pharmacy. He had accepted the responsibility of making me a pharmacist. Conscientiously, for months, he had drilled me in the art. We came to be companions. As a teacher, he was not less concerned in fitting me for my profession, than was I as a student. He considered his reputation at stake, and that he must fulfill his part. I came to understand that I, too, had a responsibility, and that unless I learned pharmacy, I would discredit both Mr. Gordon and Mr. Eger.

The stores of both Mr. Gordon and Mr. Eger were the headquarters for physicians. Discussions concerning drugs and pharmaceutical preparations, old and new, were constant. The uses and doses of remedies were alike the part of pharmacist and physician. With every prescription, I was taught to study the Dispensatory and other books of reference, to see if the dose was correct. More than once, in after years, did this watchful care serve the interest of the physician. But *only in emergency cases* did either of these preceptors ever presume to give an ailing person a remedial agent. They held that the *prescribing* was the part of the physician. This became my invariable rule, and during my entire course as prescription clerk, some fifteen years in all, I cannot recall ever breaking this rule.

At the conclusion of my work with Mr. Eger, he wrote me a recommendation that I much prize, as I do that of Mr. Gordon. I then returned to Mr. Gordon's employ, Eighth and Central Avenues, where the opportunities for business progress were greater. As Mr. Gordon did not then need my services as a clerk, he gave me at first a position as a "supernumerary clerk," in which I served, without salary, for the experience. But within a few weeks, one of the assistant clerks resigned his position, and I took his place, at six dollars a week. My salary was gradually raised to ten dollars a week, which seemed to me a very lucrative return, considering the fact that all this time I had been learning a professional business, in which I proposed to spend my life. Let me add that I take not a little pride in that, from the time my salary reached the sum of six dollars per week, I saved a goodly portion, each week.

Including these four years' apprenticeship, I clerked for nearly fifteen years, until, under the auspices and the advice of physicians whom I regarded as qualified to direct me wisely, I finally, considering myself still an apothecary, united my efforts with manufacturing pharmacists. It was during the '70's that my devotion to chemistry and pharmacy, and my acquaintance with medical subjects connected with pharmacy, led Professor John King, M. D., author of the *American Dispensatory* and other publications, to arrange with Mr. H. M. Merrell that I should take charge of the laboratory of H. M. Merrell & Company, my salary being fifteen dollars per week, which was gradually increased to twenty-five dollars. I will add that my chief reason for accepting this position, (which Dr. Stevens and others approved), was the great, unworked field of plant remedies, chiefly American, used by the Eclectic physicians. Indeed, Dr. King had made this his principal plea in urging my acceptance of the arrangement.

As a completion to the record here given I will state that I passed an examination before the Cincinnati Pharmacy Board, the first established in Ohio, and that I attended the first meeting of the Ohio Pharmaceutical Association, called for the purpose of forming a State Society. Every two years since the date of my first examination I have renewed my certificate, and am yet a licensed Ohio pharmacist, though I fear I would be sadly in need of another apprenticeship course, were I to attempt to become a clerk in a modern apothecary shop. My two brothers, Nelson Ashley and Curtis Gates, likewise took the apprenticeship method of learning the pharmacy business. Both served for years as drug clerks, both are registered pharmacists in Ohio, and neither has allowed his certificate to lapse.

*Resume.* It need not be said that I now comprehend, as I could not then, that the greatest advantage in my training as a pharmacist, came to me through the thoroughness of the drilling I received, beginning at home, and the exacting methods of my preceptors. Under these I learned self-reliance and restraint, in directions that otherwise would never have come. The very rivalries between the other boys and myself were useful, even the occasional rough usage that came in the beginning of my efforts. Sometimes, on my infrequent visits home, I would be utterly discouraged. But my mother would comfort me by teaching that after a time I would be free,\* and have a business for myself that would make

\*The word "free" is used in its sense as applied to a bonded apprentice.

me a living. Back I would go to work, hopeful and ready to meet whatever came, and I will add, always something new *came*.

I often wonder if the boy of today appreciates the educational opportunities at his command, such as the Colleges of Pharmacy, the Universities, the pharmaceutical journals, the Society meetings, the shorter hours, and the greater recreative opportunities, with which the present seems to me to contrast so markedly with the days of my apprenticeship. I wonder, too, if the apprentice of today, and the pharmacist as well, comprehends the advantages he enjoys over him of times gone by. Then, our time was largely spent in preparing remedial agents, such as tinctures, syrups, wines and vinegars, for incorporation into prescriptions. To make these, we were forced to grind and powder the crude drugs. We were busy rolling pills, making emulsions, spreading plasters, preparing suppositories and like agents that, before the days of the pharmaceutical factory, were a daily necessity. Well do I remember when *atropine* was introduced, for dilating the pupil of the eye. It came to us in the form of the alkaloid itself, and the pharmacist made it soluble with the exact amount of dilute sulphuric acid required, a very delicate process. The favorite prescription of physicians, (this was before the day of professional oculists), was one-half grain of atropine, water one ounce, sulphuric acid q. s. to make a solution. Bear in mind that this was for use *in the eye*.

In reviewing those days long past, I prize above all else, notwithstanding the hardships I then endured, the four years of personal drilling from my accomplished preceptors. To their pains-taking care, and to the habits of close observation and industry they engendered in me, I feel I owe a large measure of whatever success I have attained, as well as the privilege of contributing to pharmaceutical advancement. Well do I recall one of the visits Mr. Eger paid to my laboratory some years later. With great pride I brought to him specimens of interest, and explained my manipulative processes. Placing his hand on my head, he said, "Johnnie, I once taught you in pharmacy; now you are teaching me!" Could any apprentice have received a greater reward for his efforts? Nor can I express the pleasure that came to me in after years through the friendship of Mr. Gordon. He it was who introduced me to the American Pharmaceutical Association where, each year that I am privileged to attend, a host of friends greet me, though now, alas, a host of those who once were friends, are now missing. Very painful to me are some phases of these meetings. I see many faces unseen by others, to my ears come voices no others hear.

As a conclusion to this paper may I not, in the spirit of gratitude, present the portraits and brief biographies, written in 1894, of my two masters in pharmacy, W. J. M. Gordon, and George Eger, whose memories I so deeply revere?

WILLIAM JOHN MACLESTER GORDON.

was born in Somerset Co., Md., December 25th, 1825. When a lad, he entered as an apprentice the pharmacy of his cousin, Dr. J. W. W. Gordon, in Baltimore. While there he studied Chemistry in the University of Maryland, under Prof. Aiken. In 1848 he removed to Cincinnati. He was young, ambitious, persevering, energetic and capable. Beginning as a retail pharmacist, he soon branched into manufacturing, the firm being W. J. M. Gordon & Bro. He established the pioneer Glycerin factory of the West, and soon his name became known over the entire territory as a manufacturer, a pharmacist, and wholesale druggist. Within a period of five years his factory was burned to the ground four times, and he ultimately gave up the drug and medicine part of his business, confining himself to Glycerin, making large amounts of a quality second to none in the world. Mr. Gordon still gives this business his personal attention and carries a warm feeling for his early study, Pharmacy, about the only vacation that he takes, being to attend the meetings of the American Pharmaceutical Association.

Mr. Gordon has been President of the American Pharmaceutical Association and has always held the highest regard for its organization. In his energetic prime no man was more worthy of emulation, now, when of mature age, his mind is as deep as ever. He is a devoted worker in the Episcopal Church, a helpful, genial conversationalist and a friend of all who the community has ever been proud to have. He is the father of a wife, three daughters and one son. Mr. Gordon has devoted his life to the service of his country and to the advancement of the pharmaceutical profession. He has the honor to offer the tribute of respect, J. U. L.

GEORGE EGER.

was born August 7th, 1836. He was educated in Rottweil, Ellwangen and Ehingen. He entered the drug business as an apprentice in Esslingen, Germany, and after apprenticeship clerked in Stuttgart, Germany, and Geneva, Switzerland. Coming to America in 1855, he located at Madison, Ind. From there he went to Terre Haute, Ind., and then to St. Louis, Mo., after which he returned to Europe and attended a term in the University of Tuebingen, then returned to Covington, Ky., where he married. In 1863, he located in Cincinnati, on Central Avenue, near Mohawk Bridge.

Mr. Eger has more than once been elected President of the Cincinnati College of Pharmacy, and since its organization has been a continuous devotee to its interests. He has often contributed thereto from his private resources, and has every year served either on the Lecture Committee, the Examination Committee, or as a Trustee of the Institution. He is a member of the American Pharmaceutical Association, and a conspicuous example of many apothecaries who love their calling, not alone because of material returns, but also on account of the unselfish devotion they bear to a cause they love.

Mr. Eger has a family of seven children, and in addition has adopted five orphan children. A conscientious apothecary, he still delights in his work, and it is with pleasure that I recall the pains with which, after my course with Mr. Gordon and while I was still an apprentice, he instructed me in the details of the art. J. U. L.

These sketches were written in 1894. Since that date both Mr. Eger, (1900), and Mr. Gordon, (1909), have died. J. U. L.

Papers Presented at the Sixty-Third Annual Convention

### THE CIRCULATING LIBRARY AS A SIDE LINE FOR DRUGGISTS.\*

FRANKLIN M. APPLE, PHAR. D.

Competition has become so great in the drug business that druggists, almost without exception, are on the lookout for profitable side-lines wherewith they can increase their incomes. As can be observed on every side, various forms of side-lines (some appropriate and others inappropriate—in fact some a disgrace to our calling) have been decided upon and given a trial to test their earning value.

In presenting for your consideration the circulating library as a desirable side-line, I am aware of the fact that I am not setting forth an untried source of revenue, for many of you may have one in service in your places of business.

My main object in presenting this paper is that our experience with a circulating library may offer to you a new thought or two which may be helpful in the management of the one you have installed, or may install.

The first decision one must render when approaching this subject is the legitimacy of such a side-line in a drug store. Customs make laws, and competition oftentimes, compels those upon whom rests the obligation of providing the necessities of life for the household to search out added sources of revenue, wherewith to augment their incomes from their drug business. As the drug business is properly classified as a branch of one of the learned professions, anything that is of an educational nature, uplifting mankind and adding to the general store of culture of our citizens, can be classified as a legitimate side-line to a professional-commercial enterprise. If we compare the circulating library with some other side-lines that find their way into the shops, designated by the honored title, Pharmacy or Drug Store, it becomes apparent at the outset, that it is one of the least objectionable auxiliary sources of revenue that a druggist can adopt.

The second question that must be decided is whether it is wisest to provide one's own library, or to serve as the agent of a trustworthy concern that will co-operate honestly and heartily with you. After very careful consideration of this phase of the subject, we came to the conclusion that our interests would be served best by accepting the agency of a reliable, responsible concern that maintains headquarters in our city.

It may appear very strange to you that we chose the agency of a concern over which we had no control in preference to being master of the situation

\*Read before Section on Commercial Interests A. Ph. A., San Francisco meeting.

absolutely; but we found with the agency we could with diplomacy, more effectively control our customers as to rules, regulations, rates, excuses for inability to immediately supply a desired book, collection of rentals and charges for lost or destroyed books; and stood less liability of giving offense to our patrons, with the resultant loss of trade in other departments, including our legitimate and chief line of work, drug and chemical sales, prescription compounding and dispensing. We installed our circulating library with a determination to give the owners thereof a square deal and demand similar treatment in return. I am very happy to report that our relations with the owners, through their managers, has been uniformly, mutually satisfactory.

When we had demonstrated that we were truly co-operating with the other party to the contract, for mutual pecuniary gain, we received from them the greatest possible degree of satisfactory service to ourselves and to our patrons. Being wide-awake business men they fully realized their opportunity, and endeavored to derive the richest possible harvest from the field that we provided for their commercial venture.

The book case was given a prominent position in the salesroom, so located that young children could not reach the volumes (incidentally I will state that it was demonstrated that it is poor business policy to provide juvenile books for young readers, for several reasons which need not be mentioned here.)

The title of each and every book was recorded when received in a ledger arranged alphabetically, in front of which title the date of its receipt was noted. When it was returned to the messenger, who brought the weekly supply of new books, the date of its removal from our library was inscribed, thus giving us a complete record of its arrival and its removal.

A list was kept of the number of books received, also one of those returned each week, giving us at all times a summary of the number of books we were charged with by the owners thereof, from which we could readily check up the stock on hand, as we kept a detailed record of all volumes leaving our store.

Another record was made of the total earnings of the library; also of our income from the same (we received 25 percent of all moneys collected) whereby we could readily observe the progress being made with it, from a financial standpoint. As we were not held responsible for books that were lost, of which we had a record as to the lessee thereof, the commissions received were net income. We were never asked to pay for any books that we could thus account for, and none others disappeared.

A list of books desired by readers was kept on a loose sheet of paper, the titles of which were sent to headquarters once a week, several days prior to the day when the messenger called for delivery of new books and removal of undesirable ones. As several of the daily papers contain weekly reviews of the new books of fiction, we were able to keep posted as to titles and obtain information regarding them. Catalogues of recently printed fiction, procurable at first class book stores were also helpful to that end.

Several days prior to the day for exchange of volumes, we sent out courteous notes to those patrons against whom were charged any of the works of fiction, requesting prompt return of the same if they had finished reading them. This

frequently brought forth expressions of thanks together with the books, as they had laid them aside carelessly, and having neglected to return them, the charges thereon were accumulating.

A list of those patrons who had proven themselves unworthy to be entrusted with the custody of a book was kept on hand for ready reference and their requests for books were treated accordingly oftentimes with beneficial results.

As some works of fiction are not of the class of reading matter that one would care to have found in his (or her) possession, it is wisest to prevent their finding a resting place upon the shelves. Care must be exercised that young maidens are protected from the baneful influence of reading matter of a suggestive character.

The high standing of the prescription and drug department should be reflected in the library, for then it will be a credit to your name and an aid to your place of business. I can recall a number of desirable, intelligent, profitable customers we gained through our library; hence it can readily be seen that its benefits extend beyond its own field of usefulness.

Care must be exercised that the books do not become the innocent carriers of malignant disease germs. Where no efficient board of health is provided to safeguard the public health, extraordinary caution must be used to see that no epidemic can be traced to your library.

If you take proper interest in a circulating library, treat it as a commercial enterprise, use the censor's blue pencil judiciously and play fair with all concerned I feel certain that you will find this a satisfactory side-line and one that will add materially to your income.

---

## THE VALUE OF CONCENTRATING AND INDEXING YOUR DRUG STOCK.\*

---

MAURICE P. SCHWARTZ.

---

Owing to the rapid development of the commercial end of the drug business, the prescription department, or back part of the store, is being called upon to carry practically all the drug stock, the front of the store being given over to the sale of soda, cigars, candy, magazines, photo supplies, stationery, drug sundries and various other side-lines. This condition has been largely brought about by the curtailment of the use of drugs, the employment of high priced preparations in the filling of physicians' prescriptions, and cut rates in general, so reducing profits, that additional revenues have been made necessary to meet the ever increasing overhead expense.

To remove the drug stock to the prescription department every available inch of space must of necessity be made use of, and the stock so arranged, as to be found as quickly as possible. The best method of course is to thoroughly index all the items in the prescription department, and in the case of those drugs and preparations having several common names, to list them under each of these.

---

\* Read before Section on Commercial Interests A. Ph. A., San Francisco meeting.

and also to list the articles in the index alphabetically, regardless of classification, as often, when having several customers waiting, the classification the article comes under cannot be recalled instantly.

We are living in a swift age, people hardly take time to eat any more, and they are not willing to stand around, and wait for five or ten minutes before being served. Druggists depend entirely too much upon their memory in locating their stock. Owing to the thousands of different items carried, and the infrequent demand for a majority of these, it is impossible to remember where all the articles are, especially those which are difficult to classify. Another problem today is the retaining of good clerks and a great many sales are lost before the new clerk learns the location of the stock besides his wasting much valuable time and also causing customers to become skeptical of his knowledge of the drug business, or becoming suspicious of not obtaining that which they asked for. These conditions are overcome if you maintain a complete index. Numbered sections four or six feet wide, and from the floor to the ceiling are entirely too large to be of much benefit, as considerable time is consumed in finding the article after having located the section given in the index. The spaces numbered, should be reduced to a very small area.

Space in the front part of the store is entirely too valuable to take up with drug stock, which does not need to be displayed. By arranging artistic displays of toilet articles and various side lines carried, many sales will be made of articles which the public probably otherwise would not know you were handling.

Rental, and overhead expense in general, continue to increase yearly, and it is necessary to increase the volume of your business, to keep up with these growing expenses.

---

## THE COLLOIDAL STATE OF ALKALOIDS AND THEIR PHARMACOLOGICAL ACTIVITY.

In the first stage of the investigation of this subject, the relation between surface tension, size of particles, and toxicity is dealt with. The aqueous solutions of free alkaloids whose molecular weight exceeds a certain limit are colloidal. The surface tension of such solutions is lower than that of water. The toxicity of the solution towards fish and tadpoles is proportional to the lowering of the surface tension, so that the degree of activity may be measured by a stalagmometer. In those alkaloidal solutions which are not stable, the size of the particles and the surface tension increase with a corresponding decrease in the toxicity. The surface tension is altered by change of temperature or by the addition of antagonistic substances, or of acids. Decrease in surface tension and in the size of the particles is accompanied by increase of reaction velocity and toxicity under the conditions of the experiments. Local action of alkaloidal salts is attributed to increased alkalinity at the area of contact causing liberation of free alkaloid in the colloidal state. *J. Traube and N. Onodera (Intern. Zeit. phys. Chem. Biol.; Chem. Abstr., 1915, 9, 2,108.)*

## Editorial

E. G. EBERLE, Editor..... 63 Clinton Building, Columbus, Ohio

### EMERGENCY REVENUE LAW AND PLANS TO PROTECT THE AMERICAN MANUFACTURER.

THE program of the next Congress, at this writing, seems to include: The re-enactment of the emergency revenue laws; the repeal of that provision of the sugar schedule which would place sugar on the free list May 1, 1916; the issuance of bonds to meet the increase in the army and navy appropriations; the enactment of the anti-dumping clause of the Underwood Act, which was reported favorably by the Ways and Means Committee at the last session of Congress, but was stricken from the measure by a viva voce vote of the House; an export duty on munitions.

The provision of the Underwood bill states that a special or dumping duty equal to the difference between the export price and the fair market value shall be paid whenever articles of a kind made in the United States are imported into this country if export value is less than the fair market value, in addition to established duties; provided that the special duty shall not exceed 15% ad valorem, and that goods shall be exempt from such extra duty whenever established duties are equal to 50% ad valorem. The export price at which such goods are consigned are held in this measure to mean the exporters' price for the goods exclusive of all charges.

Secretary of Commerce Redfield's plan for dealing with the dumping problem is embodied in the following: If foreign countries attempted to ship goods into this country at a greatly reduced price the United States consular agents could demand the right to investigate the means of producing the commodity to see if the manufacturer was selling at a lower price than he should. If the agents were refused the right to make such an investigation, the American Consuls could then refuse to sign the manifests and the products could not leave the ports for the United States.

President Wilson is said to favor the Underwood bill.

Druggists are largely interested in the re-enactment of the stamp tax portion of the revenue measure, and while it may be next to impossible to avoid the present assessment, every effort should be made to prevent the inclusion of other stamp tax.

Secretary Redfield's plan of protecting the American manufacturer involves the difficulty of proving that the sale price of foreign goods in this country is less than their cost price in the country of their production. The producer's assistance in arriving at such cost might not be forthcoming and his punishment, being a citizen of a foreign country, seems also to offer further difficulties.

The evil against which this measure is aimed is more or less illusory. European nations, when peace is declared, will undoubtedly seek to regain their lost markets and resort to every possible economy.

Their industrial population is inured to economies and low wages and this applies also to their chemists: their chemical as well as other industries are fostered by the government. In this country the industries, especially if corporations, are hampered in one way or another, particularly by laws, and when a strong effort is made to develop trade which is productive of results, higher wages or less hours are demanded—there is the lack of the right kind of co-operation.

Coming back, however, to the assertion that the anticipated condition is more or less illusory, there would certainly not be economy in selling at less than cost, but extravagance, and such folly will hardly be indulged in by a nation whose debts have multiplied and where increased taxation is mandatory. We do not overlook the fact that their object might be to discourage the American manufacturers, but the purpose will be so evident that our manufacturers should be able to play the game of trade with them, even buying their stock for resale, while the foreigners are disposed to sell goods below cost of manufacture.

Another measure, which is more practicable and certainly encouraging, is the proposed amendment to the Clayton Act, permitting manufacturers in this country to organize selling agencies abroad. Similar plans have largely contributed to German industrial success. Germany, in its laws, first recognizes that combinations may do harmful acts and then provides for useful and beneficent combinations by permitting organizations under supervision and control of manufacturers and merchants into syndicates, by which the products of all members are marketed.

Our anti-trust laws have as the one object the prevention of the possibility of harmful combinations, practically drag-nets which seemingly propose, that rather than have one harmful one escape, to destroy those that are beneficent if necessary to accomplish the "seeming" chief purpose. The American chemical and drug industries can be promoted by aid of university research laboratories and government co-operation, and now is the opportune time for their development. As Mr. Geo. W. Perkins very forcefully says and repeats, "let us prepare for peace."

E. G. E.

#### THE WORLD'S RECORD FOR PERSEVERANCE.

**T**HAT the world had recognized the great naturalist, Jean Henri Fabre, was evidenced by the press of every country, when they announced in important headlines the passing away at the age of 92 years, of this unique genius. When a great scientist has practically lived in obscurity for eighty years of his life, notwithstanding that his work merited recognition during the greater part of this period, such unusual occurrence is deserving of mention in these pages, even though his studies were not intimately associated with pharmacy.

The world was not altogether to blame for the obscure life led by this investigator and author, for he preferred to live in seclusion, persistently studying and observing smaller animal life in all of its relations, so that Darwin in acknowledging Fabre's thoroughness in the minutest details, named him "the inimitable observer." It was not until 1910 that the home of this naturalist in the obscure little village, Serignan, became a Mecca for pilgrimages to the shrine of the

"Homer of Insects." The highest dignitaries of his own country and scientists from all over the world flocked here to do him homage and in the same year a great public demonstration was held in his honor.

He might have had more general and earlier recognition, for Pasteur sought him out as early as 1865 to secure his help in a silkworm plague under investigation. The haughty manner of Pasteur however was not compatible with the independent nature of Fabre, or perhaps, this should have been stated reversely. The latter would have excluded from his presence the man of rank and admitted the humblest scholar seeking for information, according to the dictates of his judgment or prejudice of the motives of the two. He was offered the private tutorship of the son and heir of the third Napoleon, but the gruff scientist declined the honor, because it would have diverted his study, although he was experiencing the pangs of poverty.

The famous naturalist chose to labor in one of the humblest of sciences in which a neglected division, the study of instinct, particularly attracted him. He lived to see the future of great results from his investigations, and entomology, as a department of science, exalted. Though his work was the most exacting, the one instrument of value he possessed, until very recent years, was his microscope. He studied insects in their minutest detail and then wrote of them in an intensive, vivid style, of their terrible instincts, their murders, their struggle for existence. He once said, "I write above all things for the young. I want them to love the natural history which you make them hate, and that is why, while keeping strictly to the domain of truth, I avoid your scientific prose."

Edmond Rostand has spoken of Fabre as the great scientist, "who thinks as a philosopher, sees as an artist, and feels and expresses himself as a poet." Dr. C. V. Legros named him "the poet of science," and quoting the same author in his biography:

"His gaze has penetrated even the most hidden dwellings, those in which the *Halictus* varnishes her cells and makes the round loaf which is to receive the egg, in which, under the cover of cocoons, murderous grubs devour slumbering nymphs; even the depths of the soil are not hidden from him, for there, thanks to his artifices, he has surprised the astonishing secret of the Minotaur.

"He sifts all doubtful stories; anecdotes, statements of supposed habits; all that is incoherent or ill observed or misinterpreted; all the 'cliches' which the makers of books pass from hand to hand.

"In place of repetition, he gives us laws, constant facts, fixed rules.

"He sets himself to decipher the meaning of old tales, skillfully disengaging the little parcel of truth which usually lies beneath a mass of incorrect or even false statements. He criticizes La Fontaine and questions the statements of Horus, Apollo and Pliny. From a mass of undigested knowledge he has created the living science of entomology."

The brief abstract will be pardoned because it so nicely depicts the development of a science.

Fabre published quite a number of elementary and popular books of science, his greatest work, *Souvenirs Entomologiques*, was crowned by the Institute of France.

Though Scheele was a different character and lived less than half the number

of years granted to Fabre, the two scientists have some striking characteristics in common; a sacrificing devotion held them to their work, spurning other distinctions and honors, limited means for investigations with the production of nearly unlimited results that shaped the respective departments of science in which their activities were so pronounced. Truly both are great examples of perseverance and achievement.

Permit the further deduction from the life of both, that information has greatest value only, when it is applicable for the development of general intelligence, which makes industrial and scientific application possible. E. G. E.

#### TRADE-MARKS AND TRADE-NAMES.

AN interesting sidelight on the inconveniences that may result from the now all too widespread attempt to appropriate the use of arbitrarily coined words as trade-marks is given in a recent note by W. Heubner (*Therap. Monat.* 1915, v. 29, p. 475). From this note it appears that the German army medical supply includes averred substitutes for aspirin, antipyrine, pyramidon, veronal, urotropin and several other widely used articles of a proprietary nature. This has become necessary because the medical officers at the front, without access to books or to well-informed pharmacists, are frequently at a loss to find the exact chemical or official title for the article of a proprietary nature with which they are otherwise thoroughly well familiar. The German army supply department recognizing the existing need has been furnishing both tablets and powders of proprietary chemicals in packages with wrappers bearing on them, in addition to the full official title, such as "Dimethylaminophenyldimethylpyrazolon," the statement "substitute for pyrazolon" with an indication of its origin, giving the number of the sanitary depot and the town or city in which it is located. Heubner points out that sooner or later the protected name for a proprietary becomes the generally accepted title for the drug or preparation and that while legal authorities may differ as to when this transformation takes place, the fact that it does take place is generally accepted and even in connection with the German trade-mark law, which provides for the registration of trade-names, this protection can extend only for a limited period of time. The same principle has already received official recognition in England, where the Board of Trade has declared aspirin, lysol and several other widely used titles of so-called new remedies to be public property and therefore open for general use.

In our own country where names of compounds are not recognized as legitimate trade-marks an effort has been made to establish them as such and to maintain proprietorship in articles because of the registration of a trade-name as a trade-mark. This practice would appear to be in contravention to that portion of the trade-mark law which provides that no mark may be legally registered which consists merely in words or devices which are descriptive of the goods or the character or quality of the goods rather than as a mark of origin. The world-wide agitation or dissatisfaction with established practices in connection with the use of trade-names promises to bring about far reaching changes in our conception of equity and right in the proprietorship of coined words.

## COMPOUND DIGESTIVE ELIXIR.

CONSIDERABLE space is devoted in the Journal of the American Medical Association to the Compound Digestive Elixir of the National Formulary and a proprietary preparation of that type.

We quote the conclusion of one of these editorials under the caption of "The N. F. Imitation of Elixir of Lactopeptine," as follows: "Thus the druggist is invited to emulate the followers of Mrs. Eddy in substituting for inconvenient knowledge a cheerful faith which seeks not to dissolve a profitable mystery. Pharmacists should not be too severely blamed, however, for adopting such an attitude; manufacturers and dealers in drugs are, after all, merchants, whose profits are in a general way directly proportionate to the amount of goods they sell. The pharmaceutical profession, however, will do well to remember that pharmacists themselves will suffer in the end from the reaction in the minds of the medical profession and the public if they persist in disregarding what they know to be true for the sake of what they find to be profitable."

We do not desire to discuss the merits of the preparation but do deny the allegation that the dispensing of this elixir is encouraged by *pharmacists* because it offers a greater or less profit. Such statement ought to have been omitted. Pharmacists can not question the right or judgment of physicians in prescribing an elixir for which there is, and has been for many years a large if not increasing demand.

We will not question that the prescribing by physicians of proprietary preparations of this type suggested the inclusion of a formula in the National Formulary; there was, however, this purpose in the minds of the pharmacists, of acquainting physicians with the components entering into this preparation. In devising the formula, they used the utmost care to have the product represent the activities of its constituents.

We admit that the name by which this preparation is now known should not have been employed, and the present revision of the National Formulary corrects this by assigning the title, "Compound Elixir of Pepsin." While we may anticipate the answer, that this does not change the character, it is a correction which should be made; as heretofore, the prescribing thereof comes within the province of the physician and the pharmacist would be derelict if he did not discharge his duty.

E. G. E.

## MR. GODBOLD'S NAME OMITTED.

THROUGH an unfortunate error in typewriting the report of the nominating committee, the name of our honorary president, F. C. Godbold of New Orleans, who was regularly nominated for membership in the Council at the San Francisco meeting, was omitted from the report and therefore from the official ballot and the omission was not detected until the ballots had been sent out to all of our members.

The oversight is deeply regretted, for while the distinction of being elected as honorary president shows the high esteem in which Mr. Godbold is held by the members of the Association, that very fact makes the error more regrettable.

That he will be selected as a candidate for the council at the 1916 meeting seems a foregone conclusion, since the member who submitted his name at San Francisco reserves the right to renew the nomination at Atlantic City. In the meantime, we are glad to note that his present term as a member of the Council does not expire until next year.

W. B. DAY.

## YEAR BOOK OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The second volume of the Year Book of the American Pharmaceutical Association has recently been delivered to the members, and, no doubt, has met with a cordial welcome from everyone. Whatever the cause of the delay in delivering the volume may have been, it will gladly be overlooked in consideration of the neatness, elegance and exhaustiveness of the book. The venerable Reporter on the Progress of Pharmacy, Professor C. Lewis Diehl, has once more shown his devotion to Pharmacy, and his unsurpassed efficiency in the work that has been under his care for so many years. From the subject matter of the book, it is hard to say to what extent the author is indebted to his co-laborers,—Harry V. Arny, Linwood A. Brown, Ernest C. Marshall, Otto Raubenheimer, Clyde M. Snow and Martin I. Wilbert; but without doubt each one of them deserves part of the credit of having produced such an excellent and serviceable book.

Considering the great number of pharmaceutical laboratories all over the world,—in the various colleges and universities, in the manufacturing houses and in the private studies of hundreds of co-laborers,—and the willingness with which the pharmaceutical press publishes the results of pharmaceutical research and inventiveness, the most serious question that confronts the Reporter on the Progress of Pharmacy is not what to put into the book, but what to leave out. Limited to a certain space, he must exercise judgment in selecting what is useful, serviceable and instructive. It would be much easier for him to present a volume of double or three times the size, by simply reprinting what he finds in the Journals of the various countries. In the selection, Mr. Diehl has always shown the best of judgment, and he also understands, in a most wonderful way, how to present the subject in a clear and concise manner, without ambiguity or unnecessary embellishment.

It has sometimes been stated that American Didactic Pharmacy is trying to run away from daily practice, and soars to heights that are unattainable to the everyday pharmacist. It appears to some, that the tendency of commercializing pharmacy in too marked a degree creates on the other side the desire for higher aims, more extensive knowledge, and depth and broadness of research and investigation.

It is not here the place to discuss this question, but it may well be stated that our Reporter succeeded in finding the proper mean between the two extremes paying attention to both tendencies of our profession, and giving each side the desired information and instruction. We congratulate our friend, C. Lewis Diehl, most heartily on the completion of this excellent volume, and we also congratulate the Association on the possession of so able a Reporter and so excellent a book.

W. C. ALPERS.

## Contributed and Selected

### PRESCRIPTION PRICES IN NEED OF REFORM.\*

HARRY B. MASON.

Prescription pricing is greatly in need of reform throughout the country. As a rule druggists charge considerably less than they should for their prescription work. They do not know what their costs and expenses are, and their selling prices are accordingly not based on real information. Often, indeed, they follow a flat system of pricing regardless of variations in cost, and utterly without any knowledge of the yield in profit—or lack of yield. Many of them, too, have failed to advance their figures in keeping with the rising scale of costs, and are selling prescriptions exactly as they were selling them twenty years ago. Between different druggists and different cities, moreover, there is the widest possible disparity, and so it is that the whole question of prescription pricing is in a state of utter chaos and confusion.

With this somewhat damning indictment to start with, let us consider for a few minutes a very interesting investigation reported upon at the last meeting of the American Pharmaceutical Association in San Francisco. F. W. Nitardy, of Denver, collected the facts about 10,000 prescriptions—1000 each, presumably, from ten men. Now passing over the ten separate tables of Mr. Nitardy, let us give the table of averages based upon the whole showing:

Estimate of hours required for compounding 1,000 prescriptions .....	215½
Cost of material .....	\$183.07
Estimated cost of time .....	81.48
Cost of containers .....	26.75
Estimated overhead expense .....	75.54
Total cost .....	\$366.84
Price received .....	504.60
Cost .....	366.84
Gross profit .....	137.76
Percentage of gross profit on selling price.....	27.3%

Now the actual facts in this table are most interesting, but Mr. Nitardy has handled them inaccurately. At the end of the table he arrives at a percentage of *gross profit* of 27.3. But this isn't a gross profit at all. Neither is it a net profit. It is not a gross profit because already the "cost of time" and what Mr. Nitardy calls "overhead expense" have been considered. And it is not a net profit because, while some of the expenses of the store have been deducted, all of them have not.

Mr. Nitardy's profit calculations, indeed, are very difficult to follow. He takes this 27.3 percent of apparent gross profit as a starting point, and then argues that you must deduct something like 25 percent from it to cover man-

\*Read before Detroit Branch A. Ph. A. October 14, 1915.

agerial and administration expense. Thus he assumes that a *net profit* is left on these prescriptions of only 2.3 percent.

Of course this is a startling condition of things if true, and it is no wonder that it had the A. Ph. A. by the ears out at San Francisco, and that the whole question of prescription pricing was discussed off and on during the entire week. Now prescription profits are low enough in all sincerity, but they aren't as low as this.

Let us take the real facts contained in Mr. Nitardy's table of averages, covering 1000 prescriptions, and let us work out a revised table leading up to accurate conclusions:

Cost of material .....	\$183.07
Cost of containers .....	26.75
Cost of labor (215½ hours) .....	81.48
Cost of general expense (outside of labor).....	100.92
<hr/>	
	\$392.22
Price received .....	\$504.60
Total cost .....	392.22
Total profit .....	112.38
Percentage of net profit.....	22%

Thus we find that these prescriptions actually yielded a net profit of 22 percent instead of 2 or 3 percent.

It may be asked, though, how I have arrived at the "cost of general expense" in the foregoing table. Well, let me explain first that Mr. Nitardy has divided his expense into three classifications—(a) labor or time consumed in actual dispensing, (b) overhead expense, and (c) managerial and administration expense. This is a somewhat unnecessary division, and Mr. Nitardy's figures are furthermore too high.

Following a different and simpler method, I have handled the question of expense in two divisions only—labor on the one hand, and all other expense, of every sort and nature, on the other hand. Mr. Nitardy gives an estimate of cost of labor, and I have accepted his figures without change. It only remains therefore to ask how I have arrived at the remaining expense.

Well, the average percentage of expense in a drug store is something like 28; it is lower in a big store and higher in a small store. The average of clerk hire, on the other hand, is about 8 percent. Inasmuch as the clerk hire is separately itemized and taken care of under the classification of time or labor, we deduct 8 percent from 28 and we have 20 percent left. This 20 percent covers absolutely every bit of other expense connected with the store—proprietor's salary, depreciation, collection losses, rent, light, heat and everything else. Twenty percent of the total selling volume of \$504.60 is \$100.92, and the latter figure is therefore put down as the "cost of general expense" in the foregoing revised table.

Now there are some other interesting conclusions that may be drawn from the table. Here they are:

Average sale price of the 1,000 prescriptions .....	\$0.50
Average cost of material and containers .....	.21
Average gross profit .....	.29
Average expense, both special and general.....	.18
Average net profit .....	.11

Just how characteristic these facts are it is a little difficult to determine. I gather that Mr. Nitardy collected his statistics from ten druggists, and that each reported on 1000 continuous prescriptions. Apparently all ten men lived in Colorado, and apparently also they were fairly large and successful druggists or they wouldn't have had the facts ready for compilation. It would seem therefore that what we have found out are the prescription averages merely of ten selected druggists.

I am rather inclined to believe, although I have no figures just now to back up the assertion, that druggists as a whole fail to do even as well as these ten men have done. But the ten men themselves vary considerably in their profit showings. In the separate tables published by Mr. Nitardy, and not repeated in this paper, it may be observed that one of the ten men attained a profit of only about one-third the general average, whereas another secured only a little in excess of one-half. A third man, on the other hand, nearly doubled the general average. If we take the best profit-maker in the bunch, and give him a rating of 100 percent perfect, the others taper along down to 25, and here you see right away the vast disparity between druggists, and the degree to which many of them fail to make their prescription business yield the profit that it ought to yield.

On several occasions I have suggested that in pricing prescriptions a druggist ought to use some such rational system as that employed by George B. Evans in Philadelphia. Mr. Evans has five or six large establishments, does a business considerably in excess of a million dollars a year, has an enormous prescription patronage, and is one of the most brilliantly successful men in the drug business of the United States. What, briefly, is Mr. Evans' method? *He gets a profit approximating 100 percent on the cost of the bare material, and then charges a dollar an hour for actual time consumed in compounding.*

Where would we land if we applied the Evans method to this table of 1000 average prescriptions? Let us see:

100 per cent advance on material.....	\$0.42
\$1.00 an hour for labor (one-fifth hour).....	.20
Selling price .....	.62
Cost .....	.21
Gross profit .....	.41
Expense .....	.18
Net profit .....	.23

By the use of the Evans method, therefore, we have an average net profit of 23 cents instead of 11 cents. This means that the net profit has been more than doubled—and it is the net profit that always tells the story. It is the net profit that you live on, that you educate your children with, and that you use in buying automobiles and theater tickets.

Please observe, too, that in order to double, and a little more than double, your actual profit yield it is only necessary to increase the selling price from 50 to 62 cents—an increase that doesn't seem on the face of it to be very great. You have likewise advanced your *percentage* of net profit, based on the selling price, from 22 to 37.

Now a net profit of 37 percent, based on the sales, is none too much when you consider the amount of space and capital involved in the prescription department, the slow turn-over, the relatively small yield, and the degree of

professional skill required for the work. For these reasons the prescription department should produce a far larger net profit than any other department in the store. It is the one place, indeed, where the drug merchant becomes a member of a skilled profession, and he ought to be paid for his professional services as other men are paid.

But the average man will always answer to this argument: "This is mighty fine reasoning. Your voice sounds melodious in my ears, but after all you are one of those accomplished theorists who can never understand practical conditions. Prescription prices are set by custom, and I can't change them. I am a creature of circumstances. I would like to help myself, but it is quite impossible."

The answer to this indictment is a very simple and convincing one. The large, successful druggists, the men who are supposed to be cut rate dealers doing business on a small net profit, are the very men who get satisfactory prices for their prescription work. The method I have advocated in this paper is the method used by one of the biggest retailers in the United States. He has found it practical and workable. Virtually the same method is used in the store in Chicago where more prescriptions are dispensed daily than in any other one establishment in the city.

Does it work? Of course it works!

When I was a youth in the drug business it was almost the universal custom to charge a flat-price for prescriptions—25 cents for a two-ounce mixture, 30 cents for a three-ounce mixture, and 40 cents for a four-ounce mixture. To a very large extent this practice still prevails, although the average prices have perhaps gone to 30, 40 and 50 cents respectively. In some cities 60 cents is gotten instead of 50 for a four-ounce mixture.

But this flat-price system is fundamentally wrong. To charge 50 cents uniformly for four ounces of medicine, regardless of greatly varying costs, is little less than ridiculous. The wall-paper dealer might as well sell all his stock uniformly at 20 cents a roll whether it costs him 4 cents or 40. The tailor might as well make every suit of clothes for \$40.00, instead of charging \$30.00 for one and \$75.00 for another.

Absurd, isn't it, when you come to think about it seriously?

More than that, other errors equally grave are committed by druggists in the pricing of prescriptions. You will often find a man who bases his price on the size of the dose. For a given mixture he will get a dollar if teaspoonful doses are ordered, and 50 or 75 cents if dessert or tablespoonful doses are indicated! Could anything be more irrational?

Many druggists are practically charging the same prices for prescriptions that they asked fifteen or twenty years ago. In the meantime several factors have contributed greatly to increase costs all along the line. In the first place, the old days when galenicals comprised almost the entire *materia medica* have largely passed into history. The foreign synthetic chemical, and the domestic pharmaceutical specialty, both of which are considerably more expensive in the very nature of things, have radically changed the situation. Costs of doing business, too, have greatly risen during the last decade, and we have here a subject that has enlisted the keenest study of

economic experts in all the large mercantile establishments throughout the country. And now nearly the entire world has plunged into a great war resulting incidentally in a marked advance in the price of a thousand and one supplies. Nevertheless, despite all these things, we find many a druggist dispensing prescriptions at pretty nearly the same old figures.

The whole question sums itself up in one conclusion from which there is no logical escape. It is this: There is only one sensible method of pricing prescriptions or anything else. *The price should be based absolutely on the cost, plus expenses, plus a reasonable net profit.* Any other method is artificial. Any other method is absurd and ridiculous. This is the simple rule followed by every capable merchant and manufacturer, in every line of trade, and with every class of goods. There is no reason on earth why prescriptions should be any exception.

The great trouble is, in conclusion, that many druggists do not know their prescription costs. They haven't taken the trouble to figure them out. But, after all, it ought to be relatively easy for any man to adopt some such principle as the Evans method. Get 100 percent advance on the cost of material and container, and charge a dollar an hour for labor.

---

### PRESCRIPTION PRICES IN DETROIT.\*

---

WALTER M. CHASE.

---

During the past month more than a score of Detroit druggists have been called upon with the object of ascertaining what prices are charged for prescriptions, and also to find out how these prices are arrived at. While, from the data obtained, it would seem that the pharmacists of Detroit tend to secure fair prices, they are not, however, in all instances getting quite adequate returns for the material and workmanship involved. Particularly is this so when the increasing costs of merchandise and labor are considered.

The stores visited were not chosen at random, but were so selected that at least one out of every type of prescription department in the city might be investigated. They included down-town establishments, neighborhood stores, and places on the outskirts of the city. Managers of the prescription departments of chain stores, basement pharmacies, pharmacies in apartment houses, so-called "cut rate" stores, department stores, and stores located in exclusive sections and in sections populated by foreigners, were all asked to give their methods.

Perhaps the most striking feature brought out by the investigation was the number of different systems in vogue for arriving at selling prices. Some druggists use the N. A. R. D. schedule or modifications of it; some follow the Evans rule of doubling the cost of materials used and adding one dollar an hour for time consumed in compounding; some have a flat price based on the size of the prescription. Others make a special price on each pre-

---

\*Read before Detroit Branch A. Ph. A. October 14 1915.

scription, getting whatever they think the customer will stand for, while still others guess at a suitable price, depending upon their knowledge of the business to make it show a satisfactory profit.

The system employed by a certain chain of stores is dictated by the company's main office in the East. The schedule is quite a complicated one, but the prices obtained from following it compare most favorably with the best figures secured in other stores throughout the city. The schedule of prices approximates that obtained by users of the Evans rule. The cost of the ingredients is doubled; a charge is added for the label and container; and compounding is charged for at the rate of about \$1.50 an hour.

One druggist, who has no set rule, told me that his price depended entirely upon the customer he had to deal with. He took into consideration the ability of the customer to pay, whether the sale was a cash or a credit one, the likelihood of a refill, and for what purpose the medicine was intended. He informed me with a grin that a prescription for solution of argyrol and santal oil capsules had to show up a better margin of profit than one for elixir of iron, quinine and strychnine.

Another druggist said that a greater part of his business came from doctors in the vicinity, and that he and these physicians had worked out a price schedule, applying to most of the prescriptions received, which was satisfactory all around. This schedule was a "double-the-cost" one with minimum prices for mixtures containing inexpensive ingredients.

There seems to be quite a tendency to furnish poor patients with medicine at a sub-normal price. One druggist who does this says he makes up the difference on the chronic medicine-takers.

There seems also to be quite a decided tendency to make transient customers pay more than regulars.

The size of dose influences prices to a considerable extent. The smaller the dose the higher the price is, in proportion.

Except in occasional instances the policy of a neighboring store seems to have but little influence. The druggist whom I found to be getting top-notch prices was located almost directly across the street from one whose figures were comparatively low. And both had high-grade stores, each enjoying considerable patronage.

A druggist who did not stick closely to a schedule said that most of his customers asked for prices at the time the prescription was handed over. He always gave them a price at once and took care that it was high enough. He admitted, however, that during the recent skyrocketing of war prices his snap judgment in several cases had cost him real money.

From the variety of schedules in force—or in some cases, the lack of them—it was to be expected that prices for the same mixture would vary considerably in different stores. Such I found to be the case.

For an ordinary one ounce prescription containing no expensive ingredients, and requiring no special manipulation to compound, prices ranging from 25 cents to 40 cents were quoted. Two druggists said that when the medicine was given in doses of a few drops each their charge would be 50 cents. Thirty-five cents was about the average charge for a one ounce mixture.

Two-ounce prescriptions ran from 35 to 50 cents. Here again the size of dose came in, and the 50-cent prices were based on 10 or 15 drop doses. The average price was about 40 cents.

On three-ounce mixtures prices of from 40 to 60 cents were the most common. Fifty cents was the average.

The greatest unanimity of price was found on four-ounce mixtures. Sixty and 65 cents seemed to be almost universal charges. Three druggists, however, claimed to get 75 cents, and two are still sticking to the antediluvian schedule calling for 50 cents.

A store that does a big patent medicine and toilet article business, but which according to the manager's statement does not care for prescription trade, considers 40 to 45 cents a fair price.

A store manager who gets exceptionally good prices says that his ordinary charge for a four-ounce mixture is usually about 60 or 65 cents. His contention is that customers sometimes kick at a 75-cent price, and in order to even up he gets 50 cents for all two and three-ounce mixtures, and even the same price for one-ounce prescriptions when the dose is small.

A druggist on the outskirts of the city sells four-ounce mixtures for 35 and 40 cents. He declares that these prices are the best he can get. That he is afraid of his shadow is evidenced by the fact that his nearest competitor is charging 60 cents and is getting the cream of the trade at that.

Six-ounce mixtures bring prices ranging from 75 to 90 cents.

For eight-ounce packages customers pay anywhere from 85 cents to \$1.25, with the majority getting off at one dollar. One druggist says he asks 95 cents because that sum doesn't strike the customer as being anywhere near so high as a dollar does.

Customers who have 16-ounce prescriptions are likely to be charged anything from \$1.25 to \$2.00.

Powders in dozen lots were quoted to me at from 25 to 60 cents. Forty and forty-five cents seem to be the average. The 25-cent man was the same one who sells four fluid ounces of a liquid for 35 or 40 cents. "Can't get any more," was his excuse.

Capsule prices run about the same as for powders with the exception of one store where 75 cents was the charge. Fifty cents a dozen seemed to be a popular charge.

The minimum charge for one ounce ointments is about 40 cents. Quite a few druggists get 50 cents, while two of them think 35 cents is enough.

To get an idea of the price a customer would have to pay for the same prescription in different stores I asked each druggist for his price on one fluid-ounce of a saturated solution of potassium iodide.

And what a conglomeration of prices I found! Here they are: 50 cents, 60 cents, 65 cents, 75 cents, 85 cents, 90 cents, \$1.00, and to top them all, a price of \$1.25! The cost of the iodide at the time of inquiry ran from \$4.50 to \$5.00 a pound, or about 30 cents an avoirdupois ounce.

One of the 50-cent men said he was satisfied with the profit that price gave him. Another said that a KI customer was usually good for a number of encores and that he was willing to take small profits repeated over a period of

months. A third said he would make a charge of 50 cents when he felt that the customer was having heavy bills for medicines and only a limited income with which to pay them.

The \$1.25 man said his customers expected the best of drugs, artistically prepared packages, special messenger service, and all the time they wanted in which to settle. Under such conditions he didn't consider that he was mulcting anyone.

In general the average price was in the neighborhood of 60 or 65 cents. A few got 75 cents or more. But great as were the variations in price, these were simply on a par with the various methods used in preparing the saturated solution itself.

To make it I found that different druggists were using anywhere from 360 to 480 grains of potassium iodide. Some used 6 drachms, some 7 drachms, some  $7\frac{1}{2}$  drachms, some one avoirdupois ounce, and some an apothecaries' ounce. In certain cases the iodide was dissolved in a graduate, water enough being added to make a volume of one fluid-ounce. In other instances the iodide was dumped into a so-called one-ounce prescription bottle and enough water poured in to fill the bottle.

A solution of which one minim will represent one grain of salt can be prepared by adding five fluid-drachms of water to an apothecaries' ounce of potassium iodide, but a solution of that strength was used in only a few instances.

Whether or not prescriptions are shopped to any great extent appears to be a mooted question. Some of the druggists say that the practice is an uncommon one, while others assert that their prices are quite often cut by competitors. In general, however, the stores doing the largest business make their prices and stick to them regardless of the other fellow.

Most of the druggists aver that they respect the N. A. R. D. cost mark when it appears on a prescription, although I found one manager who said that in his store the cost mark was looked at and that was about all. If the price was the same as his established charge for the mixture, well and good; if not, it was disregarded. He declared, however, that he did not use the cost mark as an excuse to cut under and disorganize price conditions.

One interesting fact may be stated in conclusion. Mr. Nitardy, in his recent investigation, found that the average price obtained for 10,000 prescriptions was 50 cents. The largest druggist I called on told me that it had for years been the aim of his company to attain an average price of 60 cents. This means an increased net profit of 10 cents over the average figures discovered by Mr. Nitardy.

# ADDITIONAL DATA CONCERNING THE PREPARATION OF MAGMA MAGNESIA, MILK OF MAGNESIA.

SAMUEL T. HENSEL, PH. G.

In my previous communication upon this subject which appeared in the August, 1914, issue of the Journal of the A. Ph. A., I gave an amount of water required to wash the precipitate which was based upon the instructions given in the National Formulary to "wash it until free from saline taste."

This investigation was therefore begun to determine more definitely the extent to which it is necessary to carry the washing of the magma in order to secure the practical elimination of the sodium sulphate and excess of sodium hydroxide contained in the supernatant liquor.

For the purpose of this experiment the same system originally employed was established; this consisted of,

First: A well annealed glass precipitating bottle, the exact capacity of which was found to be three gallons, six pints and a half, the ordinary measures employed in the store being used for measurement.

Second: Metathesis was effected in the manner described in my former paper, and the resulting mass introduced into the bottle for subsidence.

Third: A record was kept providing for observations made at intervals of 24 hours, of the supernatant liquor. At the expiration of each period 500 cc. (mils) of the liquor were taken for examination.

Fourth: The solid content of the 500 cc. (mils) thus taken was determined gravimetrically, this method having been selected as the quickest and most practical for the average pharmaceutical laboratory, the volumetrical analysis of the supernatant liquor requiring too much time in the absence of the requisite standardized solutions.

The results obtained, considering the means at my disposal, are remarkably accurate, as I shall presently show.

I subsequently made a third experiment, for the purpose of comparison with the following results, this time using a Beaumé hydrometer, for the determination of the solid content of the solution, as shown in experiment No. 3.

The following observations were made:

## SEDIMENTATION RECORD (SUPERNATANT LIQUOR)

Temperature 25 degrees Centigrade.

				Grains per 500 cc. (mils)	Per cent.
24 hours	Solid content	Na <sub>2</sub> SO <sub>4</sub>	and NaOH		
1st period	"	"	"	357	
2nd period	"	"	"	171	48
3rd period	"	"	"	83	48.5
4th period	Gravimetric limit			—	
5th					
6th					
7th					

## SECOND EXPERIMENT.

Period	Grains per 500 cc. (mils)	Per cent.
1st .....	374	
2nd .....	186	49.7
3rd .....	90	48.2
4th Gravimetric limit	—	

The term gravimetric limit is used upon this occasion to indicate the point at which it was difficult with the instruments at my command to make a further gravimetric measurement.

An inspection of the above observations will show that there is a uniform decrement in the solid content of the solution, and that this is a constant, approximating 50 per cent, and a measure for all subsequent decantations.

Reasoning by analogy it will be seen that after the fourth decantation the solid content will be reduced to approximately 20 grains for the whole system, and since the sedimented magma after 48 hours will occupy one-fourth of its volume (that is, the volume of the precipitating bottle), there can be only 5 grains of sodium sulphate and sodium hydroxide remaining in the interstices of the magma. Obviously if the washing had been carried to the end of the seventh washing, the solute would have attained a very high degree of attenuation.

### THIRD EXPERIMENT.

In this experiment a Beaumé hydrometer was used, and the following observations made:

Period	Solid Content Per cent by Weight	Specific Gravity	Degrees Beaumé
1st .....	8.0	1.03187	4.5
2nd .....	4.0	1.01173	2.3
3rd .....	2.0	1.00779	1.1
4th .....	1.0	1.00388	.6
Limit of physical measurement by this instrument.....			—

We have in the above measurements results which compare very closely with the results of the first two experiments, and which again indicate a uniform decrement which indicates a constant of 50 per cent.

It will be seen from the inspection of the above tables, that the limit of ponderable content is reached at the fourth decantation, and in view of the harmless nature of sodium sulphate its presence is absolutely negligible, and the application of the  $\text{BaCl}_2$  T.S. to this preparation is too severe and impracticable, since it would require the washing to be continued to infinite dilution to find a point at which a cloud would cease to be given.

While the writer is not insensible of the fact that the facilities at his command at the time this investigation was conducted were crude, the results obtained are so close to the calculated theory, as to be practically correct.

For the convenience of the readers of this paper, I herewith give the equation representing the reaction which takes place during matathesis, and which was part of my previous paper:

The manufacture of this product has been conducted many times by the writer during the past eighteen months and it has been a constant source of interest;

but it was not until he attempted this quantitative work that the significance of much that he has observed has become apparent.

Upon the examination of the first 500 cc. (mils) of the supernatant liquor, he tried to balance the total ponderable solids found, with the molecular weights as indicated by the "law of constancy of composition." He found, of course, that the 357 grains found in the 500 cc. (mils) of solution fell far short of the total molecular weight of the reacting bodies.

He then had recourse to the modern theory of electrolytic dissociation, for which we are indebted to the physical chemist, and here he found the cue which led to the explanation.

From the solubility point of view, as taught by this branch of chemical science, the dissolved magnesium sulphate (salt) and sodium hydroxide (base) in dilute or moderately dilute solution, are dissociated into their constituent ions; the ions only becoming chemically active in such diluted solutions, the molecules of water released by the magnesium sulphate remaining in the solution only as potentialities of subsequent water of crystallization.

As shown by the above equation, 10 molecules of water of crystallization have entered into combination and exist in the solution as potentialities of the crystal form of sodium sulphate,  $\text{Na}_2\text{SO}_4 + 10\text{H}_2\text{O}$ .

In solution, the water so constituted being of the same specific gravity as the solvent, nothing but the ions  $\text{Na}_2\text{SO}_4$  and the  $\text{NaOH}$  contained in the supernatant liquor are ponderable. The total molecular weights of all the reacting bodies could only be determined by the investigation of the whole system employed in effecting metathesis; in other words the 14430 cc. (mils) or the volume of the precipitating bottle employed for sedimentation.

The following calculation will show the ratio of the reacting bodies before and after metathesis according to theory:

$$\begin{array}{rcl}
 \frac{\text{Mg(OH)}_2}{\text{MgSO}_4 + 10 \text{ H}_2\text{O}} = \frac{58}{246} \times 44 \text{ equals } 10.4 \text{ ounces } \text{Mg(OH)}_2 \\
 \frac{\text{Na}_2\text{SO}_4 + 10 \text{ H}_2\text{O}}{\text{MgSO}_4 + 7 \text{ H}_2\text{O}} = \frac{322}{246} \times 44 \text{ equals } 57.6 \text{ ounces } \text{Na}_2\text{SO}_4 + 10 \text{ H}_2\text{O} \\
 \text{Total} \quad 68.0 \\
 \text{Less } 55.9\% \text{ water of crystallization} \quad 24.59 \\
 \hline
 43.41 \\
 \text{Found as shown by experiment No. 3} \\
 \text{Mg(OH)}_2 \quad 10.4 \\
 \text{Na}_2\text{SO}_4 + 10\text{H}_2\text{O} \quad 32.5 \\
 \hline
 \text{And excess NaOH} \quad 42.9 \text{ difference of } 0.5 \text{ ounces.}
 \end{array}$$

This may be accounted for in part by the loss attending the four decantations.

#### MAKING THE INITIAL SOLUTIONS.

Before closing this article I would like to say a few words in reference to making the solutions.

Great care must be exercised in making the solution of sodium hydroxide, as the temperature rises rapidly to 210 degrees Fahrenheit at this elevation (Denver), which is equivalent to a reading of 220 degrees at sea level.

All utensils used should be of granite iron ware.

Filtration of the sodium hydroxide solution must not be attempted with ordinary filtering paper for the reason that the causticity of the solution weakens the fiber of the paper, and at the same time acts on it in such a manner as to discolor the solution.

A very convenient way is to adjust two layers of plain gauze of suitable dimension by means of a rubber band to a  $\frac{1}{2}$  gallon funnel, then place a layer of absorbent cotton 1 inch in thickness and  $5 \times 5$  squarely in the center and pour the solution carefully upon it.

The solution of magnesium sulphate may be filtered through absorbent cotton or ordinary filter paper.

#### COLLECTION OF THE MAGMA.

After the fourth decantation, it is not necessary to drain the whole mass of magma, but only such an amount as will remove the required volume of supernatant liquor necessary to bring the mass to the requisite density.

The draining at this point should be done on filter paper, and the magma thus collected should be removed by means of a silver or silver plated spoon and returned to the precipitating bottle, the whole mass then vigorously shaken. By this method the minimum amount of magma is at any time exposed or brought in contact with other bodies.

Rubber stoppers should be employed for the container, as the magma will in a short time act on cork and discolor both it and the mass.

---

### THE PHARMACIST'S WORK TODAY.\*

---

H. M. WHEELEY, ST. LOUIS, MO.

---

We are living in an age of unrest which extends to all branches of human activity. Just at present, mankind is passing through a period of acute excitement which is manifest, the world over. At one time, pharmacy was a quiet, studious occupation with well fixed scope and definite limitations. Pharmacy was caught by the wave of unrest at a date prior to the memory of this generation. The pharmacist of today is so accustomed to chaotic conditions in his own vocation that he is not startled by the perturbations that are found in other lines of trade and professions nor by the heavy head lines in the daily press that but faintly reflect the present great upheaval in the political world of Europe. Only the patient and even-tempered care to remain in pharmacy, with its trials, tribulations and uncertainties. Pharmacy, as we find it, calls for men and women of evenly balanced minds to think right and well developed bodies to resist disease. The future of pharmacy must be worked out by successive generations of the kind of persons who accomplish results in spite of difficulties. We, of today must be followed by those who are peculiarly strong and competent.

It is not my purpose on this occasion to diagnose the diseases that beset pharmacy today. Nor shall I outline a course of treatment nor even indulge in that innocent and inexpensive pastime of prognosing future conditions. What I have

---

\*Address before the Colorado Pharmacal Association, at Boulder, June 23, 1915.

in mind is an exposition of a line of pharmaceutical work which has been going on quietly for two generations but is not generally recognized as "The Pharmacist's Work Today," although it is the most far-reaching in effect of all the varied activities in our calling at present.

#### THE PHARMACOPOEIA FAR-REACHING.

The Pharmacopoeia of the United States of America, as it is officially known, is more far-reaching in its influence than the drug trade at large comprehends. The Quiz Compend introduces the Pharmacopoeia to the average candidate for registration. Such persons do not become well enough acquainted with the U. S. P. to know the book even by sight. College of pharmacy students are much given to studying the Pharmacopoeia in about the same manner as boys study the Bible in the mission Sunday schools of the slums in a large city. The street urchins learn by heart certain Bible verses in order to win prizes. The pharmacy students learn names, tests and formulas as a requirement for graduation. The employes of jobbing houses know the price of the U. S. P. and the fact that it cannot be sold at cut rates. The manufacturing pharmacist and the pharmaceutical chemists gain a more adequate idea of the standard which governs their products and work. Without going into tiresome detail, let us take a general survey of the Pharmacopoeia from a safe distance and pleasant point of observation.

I shall not discuss the Pharmacopoeia from the ultra-scientific point of view. Do not place yourselves in a receptive mood for the consideration of the changes in mass and weight which is involved in the formation of complex atoms. You will not be told why the U. S. P. IX should adopt the drop weight method for the determination of the surface tension of a liquid.

#### PHARMACOPOEIA DEFINED.

A pharmacopoeia is, according to the etymology of the word, devoted to the formulas and directions for preparing medicines. Taking the United States Pharmacopoeia as a type, these authorities today define the character, establish the purity and regulate the strength of medicines for the country in which the Pharmacopoeia is issued. Twenty-three such authorities of national character are now in use. The Swiss Pharmacopoeia is published in German, French and Italian; the United States Pharmacopoeia, in English and Spanish, and the other pharmacopoeias are published in two languages. Some pharmacopoeias are legal authorities in more than one country and, on account of the itinerant habits of mankind, all of the leading pharmacopoeias are found in different countries. We, in America, use particularly the United States, the German, the British and the French Pharmacopoeias.

The first physician in the forgotten past who reduced to writing a record of his medicines brought into existence the first pharmacopoeia. In the course of time, came the hospital book of prescriptions, the formularies published by medical authorities and, in 1618, the London Pharmacopoeia. Paris also issued a pharmacopoeia in 1639. In 1699, Edinburgh published a pharmacopoeia. Then came in 1818 the first pharmacopoeia of national character. France has the credit for it and it is significant that the work was given to the world at a time when the country was in the throes of political turmoil. The United States also

realized the advantages of a National Pharmacopoeia and published its first one in 1820.

The way for a national pharmacopoeia in this country was blazed by Dr. William Brown, of a military hospital, and it was published at Lititz, Lancaster County, Pa., early in the Revolutionary War (March 12, 1778). The advantages which Dr. Brown claimed for his little volume of thirty-two pages are in keeping with the spirit of the times in Europe today. Dr. Brown says that the eighty-four formulas for internal and sixteen for external remedies are "adapted especially to our present state of need and poverty which we owe to the ferocious cruelty of the enemy and to the cruel war brought unexpectedly upon our Fatherland." "The cruel war brought unexpectedly upon our Fatherland" sounds like a recent expression in Germany, Austria, Russia, France, England, Italy and particularly Belgium.

My first activity in editorial work of a pharmaceutical nature began in 1884, at a time when the pharmaceutical world expected to soon have an International Pharmacopoeia as a result of several years of previous work. During the seventh triennial convention of the International Pharmaceutical Congress, at Chicago, in 1893, the American Pharmaceutical Association tendered the sum of one thousand dollars for use in preparing an International Pharmacopoeia. The money was never used. It has since been determined that the pharmacists of the principal countries of the world can no more agree on general formulas than can the governments of the world on a plan of international peace. In 1902, the pharmacists gave up the idea of securing an International Pharmacopoeia which would give formulas for practically all of the preparations in use by civilized man and went to the other extreme. The International Conference for the Unification of Potent Remedies which met in Brussels, thirteen years ago, came to an agreement on a few general principles to be adopted by the Pharmacopoeias of the different countries, as they are revised. The United States was then at work on the U. S. P. VIII and was the first country to fall in line. Other countries have since changed some of their standards, but to the United States belongs the honor of having fully acceded to the letter of the international agreement. These standards are only of a general character, such as making all of the stronger opium preparations 10%, the liquid arsenic preparations 1% and having a certain fixed strength for some of the most universally used potent remedies. It was this agreement which caused the Revision Committee, ten years ago, to reduce the strength of the tinctures of aconite and of veratrum and to double the percentage of drug in the tincture of strophanthus.

The physicians and pharmacists of the world can agree on a uniform percentage of strength for potent remedies, but an international Pharmacopoeia is an impossibility because they cannot decide on the color for some liquids and the flavor for other preparations nor on the worthless ingredients to be retained in a few old time remedies.

It was in January, 1817, one year before the appearance of the French Codex, which was the first Pharmacopoeia of a national character, that the Medical Society of the County of New York arranged for a convention of delegates from medical societies for the purpose of editing and publishing a national pharmacopoeia. The volume made its appearance, December 15, 1820. This conven-

tion has greatly changed in character but has met every ten years since the first assembly, at Washington, January 1, 1820. The last meeting was in May, 1910, and the next one is called for May, 1920. The Pharmacopoeia has been published from one to five years after these decennial conventions. The U. S. P. VIII, now in use, appeared in June, 1905. We may anticipate the U. S. P. IX in November or December, 1915. It is misleading to refer to the Pharmacopoeia of 1900 or the one of 1910, as no revision since the first one has been published in a decennial year. We should form the habit of speaking of the new Pharmacopoeia as the U. S. P. IX.

#### EARLY PHARMACOPOEIAL REVISION WORK.

The pharmacopoeial revision work in this country began in 1820 and was entirely in the hands of the medical profession. A few physicians, at odd moments, decided on the text of the first five publications which were authorized by the conventions of the decennial periods 1820 to 1860 inclusive. In 1852, the American Pharmaceutical Association asked for the admission of pharmacists to the pharmacopoeial revision conventions and secured representation in 1870. The U. S. P., published, December 15, 1820, is a small volume of 272 pages. One-half of the book is taken up with a Latin translation of the English text. It was soon found, however, that all Latin reading pharmacists in this country could also read English, so the Latin text was not continued in subsequent revisions. The U. S. P. of 1820 is little more than a mere list of *materia medica* titles accompanied by a collection of formulas without working directions for manipulations. Physicians do not realize the value of the Pharmacopoeia as a working manual and the revisions authorized in 1830, 1840, 1850 and 1860 made but little progress in that direction. The collection of early Pharmacopoeias in the library of the Denver Branch of the American Pharmaceutical Association will prove instructive as well as interesting to those who care to study the foundation on which the greatest work of American pharmacists is built.

#### RECENT PHARMACEUTICAL REVISION WORK.

The admission of pharmacists to the convention of 1870 led to revision along broader lines. This became more apparent with the publication of the U. S. P. VI, authorized by the convention of 1880. The book became more popular and important. The committee elected by the convention of 1890, expanded the Pharmacopoeia in a new direction. Dr. Charles O. Curtman and Professor Frederick B. Power were members of that committee. They found that the description of chemicals and the tests for purity had been copied from foreign authorities. These practical revision workers realized that the chemicals in the American drug trade do not always come from the same source as those found in Europe, nor are they always made by the same processes. The chemicals in the United States have impurities not occurring in those of foreign markets. The Pharmacopoeia gave no tests for such substances but detailed tests for impurities which never occur in the chemicals of the American market. The U. S. P. VII became a working manual for pharmaceutical chemists to an extent not covered by previous revisions. The convention of 1900 was revolutionary in character and incorporated the delegate body as the "United States Pharmacopoeial Convention." The general principles adopted and the instructions given the revision committee

all evidenced a determination to make the Pharmacopoeia more useful in the drug store, the laboratory and the office of the analyst. The U. S. P. VIII which resulted and with which we are now working is acknowledged as the most useful Pharmacopoeia in the world. In England, it has been held up as a model for the revisers of the British Pharmacopoeia. Germany gave the revision committee credit for advanced pharmacopoeial work. The convention of 1910 was the most democratic of any in the series. The gathering in 1820 was made up entirely of physicians. The deliberate body in 1910 represented medical schools, pharmacy schools, state medical associations, state pharmaceutical associations, the American Medical Association, the American Pharmaceutical Association, the American Chemical Society, the U. S. Army, the U. S. Navy, the U. S. Marine Hospital and Public Health Service, the U. S. Department of Agriculture, the U. S. Department of Commerce and Labor, the Association of Official Agricultural Chemists, the Association of State and National Food and Dairy Departments, the National Wholesale Druggists' Association, and the National Dental Association.

#### INFLUENCE OF THE FOOD AND DRUGS ACT.

Prior to the Food and Drugs Act of June, 1906, the manufacturing pharmacists, the manufacturers of medicinal chemicals and the jobbing druggists regarded the Pharmacopoeia as a joke as far as being a law and guide for them. To always follow the Pharmacopoeia never entered even the edge of their minds. When requested by the revision committee to give processes and tests for use in revision work, the information was not forthcoming. The U. S. P. VIII became official late in 1905. Early in 1906, it became apparent that the Food and Drugs Act would become a law and make the Pharmacopoeia the legal standard. The chemists in manufacturing and wholesale houses began to study the U. S. P. VIII and find fault with limits of purity and the kinds of tests. The Board of Trustees authorized a conference of the Committee on Revision with representatives of the manufacturing interests. This resulted in the publication of a four-page supplement to the first print of the U. S. P. VIII, changing a number of standards so that they could be met on a commercial basis. Medicinal purity was maintained but chemical purity not always necessitated. This was not a supplement of corrections of errors in the Pharmacopoeia but a list of revision changes which would not have been necessary if the Committee on Revision could have secured before printing the U. S. P. VIII the information which later came so freely on account of the food and drugs legislation. The full co-operation of every interest in any way associated with pharmacy or medicine is now assured for revision work. This condition should be apparent in the U. S. P. IX but will inure to a fuller extent in the preparation of the U. S. P. X, which will be authorized by the convention of May, 1920, only five years hence.

#### MEDICAL INFLUENCE ON THE PHARMACOPOEIA.

Perhaps it was appropriate for the physicians to be the only obstetricians at the birth of the U. S. P., in 1820. The doctors acted as wet nurse until 1870. The pharmacists then began a courtship and the Pharmacopoeia became wedded to them, in 1890. The chemists became the star boarder in the official family of 1910. The doctors saw the trend of affairs and made an outcry. One medical

teacher wrote a sensational article on "The Recapture of the Pharmacopoeia" and urged the medical profession to take possession of the U. S. P. at the convention of 1910. The Pharmacopoeia slipped away from the physicians because the doctors drifted away from the materia medica and therapeutics of the days of 1820. Medical schools have almost ceased to teach along lines that interest the students in the Pharmacopoeia. Few practitioners came to the convention of 1910. The Pharmacopoeia was not captured. If it had been captured, perhaps the physicians would not have known what to do with it. More medical work in pharmacopoeial revision is desirable and pharmacists should urge physicians to learn more about the Pharmacopoeia and give it greater attention in the medical schools.

#### WHY PHARMACISTS HAVE NOT DESERTED THE PHARMACOPOEIA.

Pharmacists did not follow physicians in deserting the Pharmacopoeia because of the counter trade in drug stores, which calls for drugs and domestic remedies even though the prescription trade has dwindled in volume and changed in nature until very few prescriptions call for pharmacopoeial preparations. The food and drug legislation of more recent times has increased the importance of the Pharmacopoeia to pharmacists. In some states, the law requires a Pharmacopoeia as a part of the library of each drug store. Pharmacists cannot desert the Pharmacopoeia even if they would. In fact, the importance of the work grows with each decennial revision.

#### THE SCOPE OF THE PHARMACOPOEIA.

Two extreme views are held regarding the proper scope of the Pharmacopoeia. Some contend that such an authority should include every article used in medicine which is not of a proprietary nature. A few years ago, a practitioner of medicine, high in pharmacopoeial authority, stated that, "If physicians prescribe brick dust, then brick dust should be defined by the Pharmacopoeia." Other physicians believe that only medicines of "proved therapeutic value" should be admitted to the Pharmacopoeia. The average pharmacist who holds views on this subject expects the Pharmacopoeia to cover a scope midway between these two extremes. The National Formulary relieves the situation very much as far as the retail pharmacist is concerned. The proposed Recipe Book of the American Pharmaceutical Association will still further help furnish standards for unofficial medicines of questionable therapeutic value of a discarded but not forgotten class. It is probable that the convention of 1920 will be called on to adopt very definite action on scope of the U. S. P. X.

#### LEGAL STATUS OF THE U. S. P.

The Pharmacopoeia has, by common usage, always answered the purpose of a legal standard in the various courts of this country. It was not until the Food and Drugs Act of June, 1906, that the U. S. P. was read into a national law. The ruling of the Department of Internal Revenue also holds the Pharmacopoeia to be the standard under the Harrison Anti-Narcotic Law. Various state pharmacy laws recognize the authority of the U. S. P. In practical effect, the Pharmacopoeia in this country is as much a legal standard as are any of the government-made pharmacopoeias of the old world.

## WORK OF A PHARMACOPOEIAL CONVENTION.

When the three or four hundred delegates convene at a decennial assemblage, the first work is the adoption of a set of General Principles to govern the work of a committee on revision for a period of ten years. Then comes the election of a new set of officers, the Committee on Revision and the Board of Trustees. A record of this procedure is not found in the commentaries on the U. S. P. but is given in a portion of the Pharmacopoeia which is seldom read even by teachers in schools of pharmacy. I refer to pages I to LXXV inclusive. I advise you to read this section of your Pharmacopoeia at the first opportunity. It will give you a better idea of the American Pharmacist's Work of Today.

## HOW THE COMMITTEE ON REVISION WORKS.

The work of the Committee on Revision goes on so quietly that no one realizes the nature or full extent of the task. The General Committee consists of fifty-one members who work without salary or assurance of adequate remuneration. This large body finally passes on all questions brought before it and must approve the Pharmacopoeia as a whole before the pages are electrotyped for printing. Each of the fifty-one members has a large ring cover in which to file the recent correspondence. The letters are mimeographed on legal cap size sheets. The pages are numbered consecutively and the letters dated and numbered. Canvas binders are furnished, each holding five hundred sheets of the accumulated correspondence. Thus each member has a complete set of volumes covering all of the work of the General Committee. The last circular is Number 302, dated June 9, 1915, and closes with page 1810. This means that 92310 sheets like this exhibit were mimeographed and mailed to the fifty-one members of the General Committee on Revision. The General Committee is divided into fifteen sub-committees on as many different subjects. Each one of the smaller committees has a chairman who conducts correspondence with the associates on his committee. Each member of a sub-committee has a full set of all of the correspondence of the committee. As some persons serve on two or more committees, this correspondence becomes very voluminous. The Executive Committee of fifteen receive the reports of the sub-committees and vote on them before subjects go to the General Committee for approval. The last Executive Committee letter is Number 628 and is on page 3318. These are mimeographed on letter size sheets. The Executive Committee has to date required a total of 51,770 sheets. This, together with the General Committee sheets, makes a total of 145,080 sheets to date. As sheets of both letters and circulars in addition to the above are sent to five trustees we must add 27,640 sheets, making a grand total of 172,720 sheets exclusive of the over-run for reserve sets. This statement of mechanical labor will give some idea of the mental work which has thus far been recorded. It is merely the summing up of committee work, which in turn is based on the work of individual pharmacists, the world over. The Pharmacopoeial Work of American Pharmacists is, indeed, the great work of pharmacists of this decade.

## DIGEST OF COMMENTS ON THE U. S. P.

In 1905, the government started in the Hygienic Laboratory a series of bulletins, covering all of the current comments made on the U. S. P. Ten volumes

have thus far been published. Each one contains about five hundred pages. If you desire to know what has been said about the Pharmacopoeia or any official substance by members of the Colorado Pharmacal Association, you will find it in this set of ten government publications. Copies may be purchased at a nominal price from the government printer, at Washington. No one should write a paper on an official substance without seeing what others have said on the same subject before him. This series of bulletins will give the author reference to all that has been published during ten years.

#### BOARD OF TRUSTEES OF THE U. S. P. C.

All financial transactions and business of the U. S. P. C. is transacted by a Board of Trustees of five elected members, together with the president of the Convention and the chairman of the Committee on Revision, as ex-officio members. Each member of the Board preserves the correspondence of the Board in a manner similar to that followed in the revision work. Every item of expense must be authorized by the entire Board. Bills are paid only by voucher checks which show the nature of the expense. The chairman and the secretary of the Board and the treasurer of the Convention must sign all voucher checks. The Board holds annual meetings but most of the business is transacted by mail and all are mimeographed so that the record in the hands of each Trustee is complete.

#### THE SALE OF THE PHARMACOPOEIAS.

The publication and the sale of the Pharmacopoeia is entirely in the hands of the Board of Trustees. The book is printed by one firm and another firm has the sales agency. The sales of the U. S. P. VIII began in July, 1905, and now amount to more than sixty thousand copies, for which the Board has received about one hundred and fifteen thousand dollars. The sale will continue even after the U. S. P. IX is on the market.

#### SPANISH TRANSLATION OF U. S. P.

Over twenty-five hundred copies of a Spanish translation of the U. S. P. VIII have been sold. The same firm that prints the English edition also prints the Spanish translation, but the sales agent is not the one handling the English edition. The income for the Spanish edition to date is over six thousand dollars. The Board of Trustees is now considering the advisability of having the U. S. P. IX translated into Spanish.

#### PAYMENT FOR USE OF U. S. P. TEXT.

Each revision of the Pharmacopoeia is copyrighted by the Board of Trustees. No author or publisher can legally use portions of the text of the Pharmacopoeia without having permission from the Board. A statement that this permission has been granted must be printed on the reverse of the title page. The form of notice is furnished by the Board and reads as follows:

*"Authority to use for comment the Pharmacopoeia of the United States of America, Eighth Decennial Revision, in this volume, has been granted by the Board of Trustees of the United States Pharmacopœial Convention, which Board of Trustees is in no way responsible for the accuracy of any translations of the official weights and measures, or for any statements as to strength of official preparations."*

Publishers in foreign countries as well as America recognize the copyright property and apply to the Board of Trustees for permission to use U. S. P. text in books on pharmacy or medicine. The range of payments made by those using the U. S. P. VIII text is from five to five hundred dollars. The total amount paid to date on account of the U. S. P. VIII is over three thousand dollars. It is probable that the money paid for use of the U. S. P. IX text will be a much greater sum.

#### PHARMACOPOEIAL INCOME.

The U. S. P. C. has but three sources of income. They are the sales of the Pharmacopoeia in English, the sales of the Spanish translation and the payments made for the use of text. This income since the publication of the U. S. P. VIII in 1905 amounts to about one hundred and twenty-five thousand dollars.

#### PHARMACOPOEIAL EXPENSES.

The U. S. P. C. has three sub-divisions of expense. They are, (1) Revision Work, (2) Payment for Publication and Sales and (3) The Cost of Administering the Business of the Corporation. The records are kept in a manner that shows expenses in detail so that the Convention of 1920 will know the total cost of the Spanish translation, the Committee on Revision expenses for supplies, the amount spent by the Board of Trustees for meetings and all other such details that may be of interest.

#### HONORARIA FOR PHARMACOPOEIAL WORK.

The by-laws of the U. S. P. C. provide that the members of the Board of Trustees must serve without compensation. The members of the Committee on Revision are not salaried, but the Trustees may vote them honoraria. This will be regulated by the cash balance rather than the value of the services rendered. The Committee on Revision of the U. S. P. VIII received a blanket payment of two hundred dollars for each member. Additional amounts were then paid to some of the committee who had carried the main burden of the work.

#### THE CHAIRMAN OF THE COMMITTEE ON REVISION.

The chairman of the Committee on Revision is the one officer who has constant work of responsibility, volume and detail. He is the only one who receives a fixed salary.

#### PROOF READING OF THE PHARMACOPOEIA.

Proofreading is tiresome routine and a thankless procedure at best. The proof-reading of the Pharmacopoeia where a single word or figure may cause error resulting in death is a grave responsibility. The copy is prepared with much care and the proof read by expert professionals in the publishing house. Galley proofs are furnished the fifty-one members of the General Committee on Revision. The page proofs are distributed in a similar manner. Even the proofs of the plates for the final printing are read. The first order for printing calls for ten thousand or more copies. Of this number, one or two thousand are run off, bound and placed on the market to be proof-read by the eager and critical eyes of the pharmacists at large. If errors should be reported, the plates would

be corrected before more copies are printed. I am pleased to say that serious mistakes have never been found in the printed volume.

When the metric system was introduced, the copy or the printer used the word "decimeters" in place of "centimeters" in the statement of the average length of a stick of licorice. This made the stick a giant, ten times as long as natural. A member of the Committee on Revision caught this error in the galley proof. Instead of correcting it, he merely noted with blue pencil on the margin of the paper, "Gosh! What a stick of licorice!"

#### U. S. P. PUBLICITY.

For the first time in pharmacopoeial work in this country, publicity has been given to the proposed changes in text. The Journal of the A. Ph. A. has published six instalments of Abstracts of Proposed Changes together with New Standards and Descriptions. The pharmaceutical press in general has republished much of this matter. This publicity has led to comments from pharmacists at large and will, no doubt, avoid some of the criticisms of the new work which might otherwise be expected when the U. S. P. IX is placed on the market.

#### THE NEW PHARMACOPOEIA.

The U. S. P. IX will not be ready for the opening of the schools of pharmacy, this fall, but should be on sale by the first of next year. The Board of Trustees will fix a date on which the new standard will become official. This date will be two or more months after the Pharmacopoeia is obtainable.

The Food and Drugs Act of June, 1906, makes the U. S. P. VIII the legal standard. Perhaps it will require a special act of congress to have the U. S. P. IX become the authority. This is a complication which has never before been possible. The forthcoming Pharmacopoeia will probably be some larger than the present one. The cloth binding will be replaced with buckram, which is more durable. Straps will re-enforce the back so that the book will stand more hard usage. It should be remembered, however, that it is impossible to make an acid and alkali proof book. Nor should a pharmacist expect a single copy of the Pharmacopoeia to endure drug store usage and misuse for ten years. In this connection, it is interesting to note that much more than half of the present Pharmacopoeias sold were cloth bound.

The U. S. P. IX will reflect the present high cost of living and sell for fifty cents per copy more than the U. S. P. VIII.

#### HOW THE PHARMACOPOEIA SHOULD BE REVISED.

This is a subject unto itself, too large for consideration here. The Pharmacopoeia is the greatest Work of American Pharmacists Today, because it reflects the labor of pharmacists for half a century or more. This feature of the revision plan should not be lost in the future. The committee work, however, would be more effective if in the hands of salaried persons. Perish the thought of a government revision of the Pharmacopoeia. Our present methods are not perfect, but are superior to those followed in foreign countries.

## Proceedings of the Council

Fourth, Fifth and Sixth Sessions, 1914-15. First and Second Sessions, 1915-16

### FOURTH SESSION, 1914-15.

The fourth session of the Council of the American Pharmaceutical Association for 1914-15 was held at the Hotel Bellevue, San Francisco, on Wednesday evening, August 11, 1915, at 7:30 p. m., Chairman Eberle presiding.

Present: Messrs. Mayo, Claus, Eberle, Day, Godding, Gietner, Osseward, Alpers, Snow, Koch, Freericks, Thiesing, England, Charles E. Caspari and Whelpley.

The minutes of the previous session were read and approved.

The following applications were received and the applicants elected:

No. 302. Thomas S. Newby, Ventura, Cal., rec. by C. M. McKellips and E. L. Newcomb.

No. 303. William Joseph Nolan, 8 Allston St., Boston, Mass., rec. by Theodore J. Bradley and C. H. Packard.

No. 304. Henry Lees Smith, 604 Mission St., San Francisco, Cal., rec. by F. W. Nitardy and Albert Schneider.

The question of insuring the property of the Association now stored with the Lloyd Library of Cincinnati, was discussed, having been referred to the Council by the general session with power to act.

On motion of W. C. Alpers, seconded by Dr. H. M. Whelpley, the matter was referred to a special committee of three to report to the Council. The committee named was: F. H. Freericks, Chairman, E. H. Thiesing and T. D. Wetterstroem.

The subject of the work of the Year Book and National Formulary was brought up by Dr. H. M. Whelpley and discussed at length.

On motion of C. A. Mayo, seconded by J. W. England, a committee of five was directed to be appointed to consider the question and to report at the session of the Council to be held on Thursday evening, August 12, 1915.

The committee named was: J. W. England, Chairman; C. A. Mayo, Dr. H. M. Whelpley, C. M. Snow and J. A. Koch.

The Report of the Committee on Recipe Book, or rather a recommendation of the same, that the Committee on Recipe Book be composed of fourteen members (instead of seven members as at present), with terms of office of five years each, and that the terms of three members shall expire each year, was presented, having been referred to the Council by the Section on Practical Pharmacy and Dispensing.

On motion of C. M. Snow, seconded by C. Osseward, it was directed that such a committee be appointed to take the place of the present Committee on Recipe Book, but that it should consist of fifteen members, including the Chairman, and that it be so selected that three shall serve for one year, three for two years, three for three years, three for four years, and three (including the Chairman) for five years, and thereafter, as terms expire, each member shall serve for a five year term.

On motion of W. B. Day, seconded by E. H. Freericks, the appropriation in the Budget for Miscellaneous Expenses for 1915 was increased \$100.

On motion of J. A. Koch seconded by Charles E. Caspari, the appropriation on the Budget for Salaries for 1915 was increased \$1125.

Adjourned to meet Thursday, August 12, 1915, at 7:30 p. m.

J. W. ENGLAND, Secretary.

## FIFTH SESSION, 1914-15.

The fifth session of the Council of the American Pharmaceutical Association for 1914-15 was held at the Hotel Bellevue, on Thursday evening, August 12, 1915, at 7:30 p. m., Chairman Eberle presiding.

Present: Messrs. Claus, Day, Eberle, Engelhardt, England, Gietner, Godding, Snow, Mayo, Osseward and Whelpley.

The Report of the Special Committee on Year Book and National Formulary was presented, as follows:

SAN FRANCISCO, CAL., August 12, 1915.

*To the Members of the Council:*

GENTLEMEN—Your Special Committee on Year Book and National Formulary, appointed at your last session, would report as follows:

Professor C. Lewis Diehl's long years of valuable service as Reporter on the Progress of Pharmacy demands recognition, and in accordance with the precedent hitherto followed at the completion of the previous editions of the National Formulary (when as Chairman of the Committee on National Formulary he was voted an honorarium for his services), and the further fact that the work of the forthcoming edition is practically completed, we recommend that he be now voted an honorarium for his services for this edition.

Professor Diehl writes that he is no longer young, and, like younger men, able to apply himself to his tasks without frequent intermissions for rest, and it is felt, as expressed by the members of the Council last evening, that in justice to the interests of the American Pharmaceutical Association, as well as to Professor Diehl, he should not be expected to continue his arduous and responsible labor as Reporter on the Progress of Pharmacy and Chairman of the Committee on National Formulary, but that successors should be chosen to take over his work; the salary of the Reporter on the Progress of Pharmacy to be reduced to \$600 a year for the present.

We recommend, also, that Professor C. Lewis Diehl be retained as titular Chairman of the Committee on National Formulary, but that there be created, by resolution, the position of Vice Chairman of the Committee on National Formulary, and that the Vice Chairman be given full authority to act as the Chairman, or as an Acting Chairman, until further change, and that the Vice Chairman or Acting Chairman, be chosen from the membership of the Committee on National Formulary by the Council.

J. W. ENGLAND, Chairman,  
H. M. WHELPLEY,  
C. M. SNOW,  
J. A. KOCH,  
C. A. MAYO.

The report was received and the recommendations adopted.

The following Committee on Nominations of the Council was named: Messrs. England, Day and Claus.

A recommendation was presented from the Section on Education and Legislation that the annual appropriation to this Section for 1916 be increased \$100. It was referred to the Committee on Finance.

A recommendation was presented from the Historical Section asking that steps be taken to secure autobiographical data and photographs of newly elected members.

C. A. Mayo moved, seconded by J. W. England, that

WHEREAS, It is desirable to obtain as complete data as possible concerning the members of the American Pharmaceutical Association; therefore, be it

*Resolved*, That every member of the Association be requested by the Treasurer to furnish to the Historian of the Association a recent photograph and a brief autobiography.

Carried.

Adjourned until Friday, August 13, 1915, at 9 a. m.

J. W. ENGLAND, Secretary.

## SIXTH SESSION, 1914-15.

The sixth session of the Council of the American Pharmaceutical Association for 1914-15 was held at the Hotel Bellevue, San Francisco, on Friday morning, August 13, 1915, at 9 a. m., Chairman Eberle presiding.

Present: Messrs. Eberle, Godding, Whelpley, Day, Koch, Claus, Mayo, Dawson, Snow and England.

The minutes of the previous meeting were read and approved.

J. A. Koch, Chairman of the Committee on Finance, proposed the adoption of the following "Rule of Finance," which was adopted:

Rule 14. *Disposal of Receipts from National Formulary*: The Treasurer shall keep a separate and accurate account of all receipts and disbursements for the National Formulary. Any balance of receipts in excess of disbursements remaining to the credit of this account at the end of any fiscal year shall be credited to the Endowment Fund and become a part thereof.

On motion of C. A. Mayo, seconded by J. A. Koch, the rule was adopted.

On motion of W. C. Alpers, seconded by J. W. England, the amendment of Chapter VIII, Article V, proposed by the Committee on Constitution and By-Laws at the Council meeting of August 9, 1915, was approved.

Adjourned *sine die*.

J. W. ENGLAND, Secretary.

#### FIRST SESSION, 1915-16.

The first session of the Council for 1915-16, or reorganization meeting, was held at the Hotel Bellevue, San Francisco, on Friday morning, August 13, 1915, at 9:30 a. m., Dr. H. M. Whelpley acting as Chairman pro tem.

Present: Messrs. Eberle, Army, Day, Whelpley, Alpers, Koch, Freericks, Scoville, Godding, Weinstein, Claus, Snow.

The following officials were duly elected. Chairman, Eugene G. Eberle; Vice Chairman, John G. Godding; Secretary, Joseph W. England; General Secretary, William B. Day; Treasurer, Henry M. Whelpley; Editor of the Journal, Eugene G. Eberle.

C. A. Mayo moved, seconded by H. M. Whelpley, that the Council elect the Reporter on the Progress of Pharmacy for 1915-16 at a salary of \$600 a year. Several nominations were made, and Julius A. Koch was elected.

The nominations for the Committees of the Council for 1915-16, as recommended by the Committee on Nominations, were accepted and the nominees elected. The committees were:

*Committee on Finance*—J. A. Koch, Chairman; Otto F. Claus, E. H. LaPierre.

*Committee on Publication*—J. W. England, Chairman; George M. Beringer, E. Fullerton Cook, F. J. Wulling, Harry B. Mason. *Ex-Officio Members*—The Editor, Reporter on the Progress of Pharmacy, General Secretary and Treasurer.

*Committee on Invested and Trust Funds*—Wm. B. Day, Chairman; Charles Holzhauer, E. G. Eberle; H. M. Whelpley, ex-officio.

*Committee on Centennial Fund*—John G. Godding, Chairman; Wm. B. Day, J. A. Koch.

*Auditing Committee*—Otto F. Claus, F. W. Sultan, E. O. Pauley.

*Committee on Transportation*—Thos. F. Main, Chairman; Wm. B. Day, Lewis C. Hopp, H. M. Whelpley, Charles G. Merrell, Charles Caspari, Jr., Fred I. Lackenbach, E. Floyd Allen, F. C. Godbold, W. S. Elkins, Jr., C. Herbert Packard and F. W. Nitardy. The General Secretary and Local Secretary, ex-officio.

*Committee on Unofficial Standards*—Elmer E. Wyckoff, J. A. Koch, L. D. Havenhill and E. L. Newcomb; George M. Beringer, Chairman.

W. L. Scoville suggested the desirability of having a standard local badge at the annual meetings.

W. B. Day moved, seconded by C. A. Mayo, that the General Secretary instruct the Local Secretaries that all local badges adopted must have the approval of the General Secretary. Carried.

On motion of H. M. Whelpley, seconded by C. A. Mayo, Fabius C. Godbold, of New Orleans, was elected Honorary President.

Adjourned to meet at the call of the chair

J. W. ENGLAND, Secretary.

#### SECOND SESSION, 1915-16.

The second session of the Council for 1915-16 was held at the Hotel Bellevue, San Francisco, on Friday afternoon, August 13, 1915, at 1 p. m., Chairman Eberle presiding.

Present: Messrs. England, Whelpley, Mayo, Freericks, Day, Koch, Scoville, Godding, Claus and LaPierre.

The reading of the minutes of the previous meeting was dispensed with.

H. M. Whelpley moved, seconded by E. H. LaPierre that an honorarium of \$1000 be voted to Professor C. Lewis Diehl for his work on the National Formulary, Fourth Edition, to be paid in two installments, one installment of \$500 now, and the other during the year 1916. Carried.

C. A. Mayo moved, seconded by H. M. Whelpley, that the term of office of the Reporter on the Progress of Pharmacy cease on September 1, 1915, and that the term of office of the newly-elected Reporter on the Progress of Pharmacy take effect as of the same date. Carried.

On motion of H. V. Arny, seconded by J. W. England, Wilbur L. Scoville was elected Vice Chairman of the Committee on National Formulary, with authority to act as chairman.

On motion of J. W. England, seconded by H. M. Whelpley, all reference in the minutes to the filling of the position of Reporter on the Progress of Pharmacy was directed to be expunged from the minutes, except the final action.

F. H. Freericks moved, seconded by H. V. Arny, that C. Mahlon Kline, of Philadelphia, be elected Local Secretary for 1916. Carried.

Adjourned.

J. W. ENGLAND, Secretary.

---

### OFFICERS-ELECT OF AMERICAN PHARMACEUTICAL ASSOCIATION, 1916-1917

The Board of Canvassers met November 4th and have reported the following as the result of the election of officers for the year 1916-17:

President—Frederick J. Wulling, Minneapolis, Minn.

First Vice-President—Leonard A. Seltzer, Detroit, Mich.

Second Vice-President—Lucius E. Sayre, Lawrence, Kansas.

Third Vice-President—Philip Asher, New Orleans, La.

Members of the Council—James H. Beal, Urbana, Ill.; William C. Alpers, Cleveland, Ohio; Harry B. Mason, Detroit, Mich.

The Board of Canvassers is composed of the following members: A. H. Clark, Chairman; Wm. Bodemann, S. K. Sass, C. W. Patterson, B. L. Eicher.

The Board of Canvassers has made a recommendation that on future ballots a square be placed before each name for the guidance of the voter and to facilitate the counting of the ballots.

## REPORT OF THE COMMITTEE ON UNOFFICIAL STANDARDS.

The following portion of the report of the Committee on Unofficial Standards relates to certain crude drugs and chemicals suggested for inclusion in the next revision of the National Formulary, and by order of the Council is published in the Journal in order to afford opportunity for discussion before the standards proposed are finally adopted.

Manufacturers, importers, analysts, and others interested in any of the proposed standards, are requested to send their criticisms and comments to the chairman of the committee, George M. Beringer, 501 Federal St., Camden, N. J.

## PAREIRA

Pareira. Pareira brava.

The dried root of *Chondrodendron tomentosum* Ruiz et Pavon (Fam. *Menispermaceae*), without admixture of more than 5 percent of stems and other foreign matter.

Nearly cylindrical, more or less tortuous, of variable length and 1 to 6 cm. in diameter; externally brownish-black or blackish-brown with transverse ridges on knot-like projections, occasionally fissured and longitudinally wrinkled or even furrowed; hard, heavy and tough; when freshly cut having a waxy lustre; the transverse surfaces exhibiting several, successive eccentric and distinctly radiate, concentric zones of projecting, secondary, fibrovascular bundles, each 2 to 4 mm. in width and separated by distinct, concentric zones of parenchyma and stone cells; odor slight; taste very bitter.

Stems deeply furrowed, grayish in color, usually covered with foliaceous patches of lichens bearing their blackish apothecia; internally grayish-yellow, with a prominent development of wood and without a waxy lustre.

*Powder*—Dark brown; containing numerous starch grains and a few woody fragments; starch grains mostly single, occasionally unequally 2- to 4-compound, the individual grains ellipsoidal, or oblong, 0.005 to 0.020 mm. in diameter, and occasionally with central clefts or irregular markings; fragments with large, wide tracheae the walls with numerous slit-like pores and associated with long, thick-walled, strongly lignified, porous wood-fibres; stone cells in small groups, with thick porous walls and in form resembling those of fruits and seeds; fragments of starch-bearing parenchyma; cells of the root, thick-walled, strongly lignified

and with large longitudinal, elliptical pores; occasional fragments of blackish-brown cork.

The yield of ash should not exceed 5 percent.

## PHYTOLACCA

Phytolacca. Poke Root.

The dried root of *Phytolacca decandra* Linné (Fam. *Phytolaccaceae*), collected in autumn.

Cylindrical, somewhat tapering, sparingly branched, 3 to 7 cm. thick, mostly in transverse of longitudinal slices; externally yellowish-brown, finely longitudinally or spirally wrinkled and thickly annulate with lighter colored, low ridges; fracture fibrous, characterized by alternating layers of fibrovascular tissue and parenchyma, the layers of the latter being much retracted; odor slight; taste sweetish, afterwards highly acrid.

The yield of ash does not exceed 12 percent.

*Average dose*.—Emetic, 1 Gm. (15 grains).  
Alterative, 0.125 Gm.=125 milligrammes (2 grains).

## PIMENTA

Pimenta. Allspice.

The dried, nearly ripe fruits of *Pimenta officinalis* Lindley (Fam. *Myrtaceae*), without admixture of more than 5 percent of stems and foreign matter.

Subglobular, 4 to 7 mm. in diameter, summits with 4 calyx-teeth forming a minute ring; externally dark brown, somewhat rough and glandular-punctate; pericarp brittle, about 1 mm. in thickness; 2-locular and 2-seeded; dissepiments thin; seeds plano-convex, slightly reniform, externally reddish-brown, smooth, somewhat wrinkled and shiny; odor and taste, particularly of the pericarp, aromatic and distinct.

*Powder*—Reddish-brown or dark brown; consisting chiefly of irregular fragments and numerous starch grains, the latter being either single or compound, the individual grains spherical, plano-convex or polygonal, and frequently with a central circular marking or cleft, from 0.003 to 0.015 mm. in diameter; stone cells numerous of tabular, pyriform or variable shape and with thick porous and strongly lignified walls, the lumina frequently filled with a yellowish- or reddish-brown amorphous substance; fragments with oil secretion reservoirs containing globules of a yellowish-brown oil; and parenchyma cells with reddish-brown tannin masses. Stem fragments very few, and characterized by more or less curved, thick-walled, non-glandular hairs, rosette aggregates of calcium oxalate, from 0.006 to 0.017 mm. in diameter, tracheid-like tissues of the wood and long, narrow bast-fibers.

The yield of crude fiber should not exceed 25 percent.

The yield of ash should not exceed 6 percent. The amount of the ash insoluble in diluted hydrochloric acid should not exceed 0.5 percent.

#### PLUMBI IODIDUM

##### Lead Iodide.

It should contain not less than 98 percent of pure Lead Iodide ( $PbI_2=460.94$ ). It should be kept in well-stoppered bottles, protected from light.

A heavy, bright yellow powder, without odor or taste; permanent in the air.

Soluble in about 1300 parts of water at 25° C., and in about 200 parts of boiling water, separating from the latter solution on cooling in brilliant, golden-yellow, crystalline laminae; very slightly soluble in alcohol, but soluble, without color, in solutions of the fixed alkalis, in concentrated solutions of the alkali acetates, of potassium iodide, and of sodium thiosulphate, and in a hot solution of ammonium chloride.

When moderately heated, the salt fuses to a thick, reddish-brown liquid, which congeals, on cooling, to a yellow, crystalline mass. At a higher temperature it is decomposed, with the evolution of violet vapors of iodine, leaving a lemon-yellow residue of lead oxyiodide.

If 1 Gm. of the salt be triturated with 2

Gm. of ammonium chloride and 2 mils of water, a nearly white mixture will result. If this be transferred to a test-tube, and heated in a water-bath for a few minutes, a clear and almost colorless solution should be formed (absence of *chromate* and other *insoluble foreign salts*). On cooling this solution, a solid mass of nearly colorless, fine, silky crystals will be produced, and on adding water or diluted sulphuric acid to this mass, lead iodide will separate.

Add 0.1 Gm. of the salt to 5 mils of water, and heat the mixture until it boils; cool the liquid and filter it into a test-tube of about 40 mils capacity, then add 5 mils of potassium hydroxide T. S. and about 0.2 Gm. of aluminum wire; insert in the upper portion of the test-tube a pledget of purified cotton, and over the mouth, place a piece of moistened, red litmus paper; then if the tube be heated on a water-bath for fifteen minutes, no blue coloration of the paper should be discernible (*limit of nitrate*).

Boil 1.5 Gms. of Lead Iodide with 15 mils of water, cool and filter. 5 mils of this filtrate, from which the lead has been removed by hydrogen sulphide, when filtered, evaporated and gently ignited should leave not more than 0.002 Gm. of residue (*soluble foreign salts*).

To another portion of 5 mils of the filtrate, add a slight excess of silver nitrate T. S., filter and add to the filtrate a slight excess of diluted hydrochloric acid and refilter. On neutralizing this filtrate with ammonia water and then adding a drop of ferric chloride T. S., no red color should be produced (*acetate*).

*Assay*—Weigh accurately about 0.8 Gm. of Lead Iodide and dissolve it in a measured volume of potassium hydroxide T. S., (the chloride content of which has been determined), add 50 mils of tenth-normal silver nitrate V. S., acidulate with diluted nitric acid. Then add 2 mils of ferric-ammonium sulphate T. S. and titrate with tenth-normal potassium sulphocyanate V. S. It shows not less than 98 percent  $PbI_2$  after making allowance for the chloride content of the potassium hydroxide used in effecting solution.

Each mil of tenth-normal silver nitrate V. S., consumed corresponds to 0.023017 Gm. of  $PbI_2$ .

Each Gm. of Lead Iodide is equivalent to 42.52 mils of tenth-normal silver nitrate V. S.

## POTASSII CHLORIDUM

## Potassium Chloride.

It should contain, when dried to constant weight at 100° C., not less than 99 percent of Potassium Chloride ( $KCl=74.56$ ). It should be kept in well-stoppered bottles.

Colorless, elongated prismatic or cubical crystals, or a white, granular powder, permanent in dry air; odorless; taste saline.

Soluble in 2.8 parts of water at 25° C.; slightly more soluble in boiling water; insoluble in alcohol.

When heated the dry salt decrepitates. To a non-luminous flame it imparts a violet color unmasked by yellow.

An aqueous solution of the salt yields with silver nitrate T. S. a white curdy precipitate insoluble in nitric acid but soluble in an excess of ammonia water.

An aqueous solution (1 in 10) must be clear and neutral to litmus paper.

5 mls. of an aqueous solution (1 in 10) after boiling, must not be rendered cloudy within 15 minutes after the addition of an equal volume of barium hydroxide T. S.

10 mls. of an aqueous solution (1 in 25) must not respond to the U. S. P. Modified Gutzeit Test for *Arsenic*.

10 mls. of an aqueous solution (1 in 50) must not respond to the U. S. P. Time Limit Test for *Heavy Metals*.

Dissolve 2 Gm. of the salt in 6 mls. of water, add 1 mil. of chloroform followed by the addition, drop by drop, of 5 mls. of half strength chlorine water with constant agitation, the chloroform must not acquire a violet or an orange color (*Iodides or bromides*).

Assay—Weigh accurately about 0.25 Gm. of Potassium Chloride, previously dried to constant weight, dissolve it in 25 mls. of distilled water in a flask graduated at 200 mls. Add 50 mls. of tenth normal silver nitrate V. S. to the solution, and, after adding 5 mls. of nitric acid add sufficient distilled water to make the volume up to 200 mls. and thoroughly mix the liquid. Filter the mixture through a dry filter and collect the first 20 mls. of filtrate, then collect 100 mls. of the filtrate, add to this 2 mls. of ferric ammonium sulphate T. S. and titrate with tenth normal potassium sulphocyanate V. S. It indicates not less than 99 percent of Potassium Chloride.

Each mil. of tenth normal silver nitrate V. S. corresponds to 0.007456 Gm. Potassium

Chloride. Each gramme of Potassium Chloride, dried to constant weight, corresponds to at least 132.8 mls. of tenth-normal silver nitrate V. S.

## POTASSII GLYCEROPHOSPHAS

## Potassium Glycerophosphate.

It contains not less than 65 percent of anhydrous potassium glycerophosphate ( $K_2C_3H_5(OH)_2PO_4=248.31$ ). Preserve it in well-stoppered bottles.

Potassium Glycerophosphate is a colorless or yellowish, syrupy liquid or semi-solid mass, odorless and having a saline taste.

It is very soluble in water, almost insoluble in alcohol.

Its aqueous solution is alkaline to litmus and slightly alkaline to phenolphthalein.

When strongly heated it is decomposed, evolving inflammable vapors and at a red heat it is converted into potassium pyrophosphate.

An aqueous solution of the salt (1 in 5) mixed with a few mls. of acetic acid yields with sodium bitartrate T. S. a white crystalline precipitate, soluble in alkali hydroxides or carbonates.

To 10 mls. of an aqueous solution of the Salt (1 in 10) add 10 mls. of ammonium molybdate T. S. and warm the mixture in a water bath to 40° C., no precipitate should form within 15 minutes (*Phosphate*). On prolonged heating, or more quickly at a higher temperature, a yellow precipitate will be formed.

The red color produced by the addition of 3 drops of phenolphthalein T. S. to a solution of 1 Gm. of the salt in 10 mls. of distilled water is discharged by the addition of 1.5 mls. of tenth-normal sulphuric acid (*limit free alkali*).

10 mls. of the aqueous solution (1 in 50) does not respond to the U. S. P. Test for *heavy metals*.

Triturate 1 Gm. of Potassium Glycerophosphate for 5 minutes with 20 mls. of dehydrated alcohol and filter the mixture, and evaporate the filtrate to dryness at a temperature not exceeding 70° C., the weight of the residue does not amount to more than 1 percent, (*Glycerin and other soluble substances*).

Assay—Weigh accurately about 3 Gm. of potassium Glycerophosphate, dissolve it in 30 mls. of distilled water and titrate the solution with half-normal hydrochloric acid V. S.,

using methyl orange as indicator. It indicates not less than 65 percent of anhydrous potassium glycerophosphate. Each mil of half-normal hydrochloric acid V. S. consumed corresponds to 0.124155 Gm. of  $(K_2C_6H_5(OH)_2PO_4)$ . Each Gm. of Potassium Glycerophosphate is equivalent to 5.24 mils of half-normal hydrochloric acid V. S.

### PRUNUM

Prune.

The partly dried ripe fruit of *Prunus domestica* Linné (Fam. *Rosaceae*).

Oblong, ellipsoidal, more or less compressed, 3 to 4 cm. long; externally brownish-black, shrivelled; the sarcocarp sweet and acidulous; putamen hard, smooth or irregularly ridged; the seed, shaped like that of the almond but smaller, and of a bitter-almond taste.

### PULSATILLA

Pulsatilla.

Pasque Flower. Meadow Anemone.

The dried herb of *Anemone Pulsatilla* Linné, *Anemone pratensis* Linné or of *Anemone patens* Linné (Fam. *Ranunculaceae*), with not more than 5 percent of foreign substances.

Leaves and flowering scapes matted, silky-villous; basal leaves with petioles up to 30 cm. in length, the latter hollow often purplish in color, the blades twice or thrice deeply three or four parted or pinnately cleft, the lobes linear and acute, the base of the petiole more hairy than above and frequently attached to the short root stock; flowering scapes up to 30 cm. in length, solid in the lower portion and hollow in the upper part, with sessile, involucrel dissected leaves near the flower, occasionally with remains of the dull purple, hairy sepals and the dense woolly, plumose-tailed akenes; nearly odorless; taste very acrid.

The powder when viewed with the microscope, shows numerous simple thick walled hairs up to 2.5 mm. long and up to 0.020 mm. thick; tracheæ up to 0.030 mm. broad with spiral markings or with simple or bordered pores; fragments of epidermal tissue with stoma, the latter being broadly elliptical and up to 0.050 mm. in length; some epidermal cells with wavy vertical walls. Calcium oxalate crystals and starch grains are few or wanting.

An infusion of the drug is of a light yel-

low color which is intensified upon the addition of an alkali.

The yield of ash should not exceed 10 percent.

### QUERCUS

White Oak Bark.

The dried bark of the trunk and branches of *Quercus alba* Linné (Fam. *Cupuliferae*), deprived of the periderm.

In nearly flat pieces, 2 to 10 mm. thick; externally light brown, becoming darker with age, rough-fibrous; fracture uneven, coarsely fibrous; odor distinct; taste strongly astringent; not tingeing the saliva yellow when chewed.

### QUILLAJA

Quillaja. Soap Bark.

The dried bark of *Quillaja Saponaria* Molina (Fam. *Rosaceae*), deprived of the periderm.

In flat pieces of variable length, 3 to 8 mm. thick, or in small chips, outer surface brownish-white, often with small patches of cork attached, otherwise nearly smooth; inner surface yellowish-white, nearly smooth, with occasional circular depressions, conical projections or transverse channels; fracture uneven and strongly fibrous, the laminae oblique to each other; odor slight; taste acrid.

The powder is strongly sternutatory, and contains calcium oxalate in monoclinic pyramids and prisms from 0.035 to 0.200 mm. long.

The yield of ash should not exceed 15 percent.

### RENNINUM

Rennin.

The partially purified milk curdling enzyme, obtained from the glandular layer of the stomach of the calf *Bos taurus* Linné (Fam. *Bovidae*) and capable, when assayed by the process given below, of coagulating not less than 12,500 times its weight of normal, fresh cow's milk. As rennin deteriorates rapidly it should be kept in well-stoppered, amber-colored bottles and stored in a cool place, and not exposed to sunlight.

If it is desired to use a diluent for reducing Rennin of a higher coagulating power to the standard, sodium chloride and sugar of milk may be employed for this purpose.

A grayish-white or yellowish-white powder or pale yellow grains or scales having a characteristic and slightly saline taste and a

peculiar, not unpleasant odor. It should not be more than slightly hygroscopic.

It is slowly soluble in water and in diluted alcohol, the solutions being more or less opalescent.

When mounted in water or alcohol and examined microscopically, it shows no cellular structure and no blue coloration is produced on the addition of iodine T. S.

Assay—Mix 0.1 Gm. of Rennin with 50 mls of distilled water by stirring (vigorous shaking or violent agitation of this liquid must be avoided), and allow the liquid to stand for exactly 15 minutes. Place 50 mls of normal fresh cow's milk in a beaker about 12 cm. high and 5 cm. wide and warm rapidly on a water-bath to 43° C., add 2 mls of the rennin solution and stir the mixture slowly for 10 seconds. Maintain the temperature of the bath at 43° C. and at the expiration of 7½ minutes after the addition of the rennin solution, remove the beaker from the bath and tip it to an angle of 45 degrees. The milk must have lost its fluidity to the extent of exhibiting a decidedly convex surface. An additional 30 seconds on the water-bath should produce a firm curd.

#### RHUS GLABRA

*Rhus Glabra*. Sumach Berries.

The dried ripe fruits of *Rhus glabra* Linné (Fam. *Anacardiaceae*), without admixture of more than 5 percent of stems and other foreign matter.

Nearly globular, ovoid, more or less reniform, somewhat compressed, 5 mm. in length, 2 mm. in diameter; externally dark red, velvety with short hairs, summit with remains of the short style, base occasionally with the 5-cleft calyx and a short peduncle; endocarp, smooth, shiny, light red; 1-locular, 1-seeded; seeds dark brown, smooth, inodorous, taste acidulous and slightly astringent.

*Poroder*—Brownish red, under the microscope exhibits irregular fragments; non-glandular hairs, more or less elliptical or ovoid or spatulate; 0.150 mm. in length, 0.045 to 0.080 mm. in width, filled with a pink or red colored cell sap in which occasionally occur rod-shaped crystals; glandular hairs with a short 4-celled stalk and multicellular head, from 0.045 to 0.075 mm. in length; numerous fragments of endosperm; fragments of endocarp showing very small stone cells with irregularly thickened walls, readily determined by the use of aniline sul-

phate T. S. and sulphuric acid; fragments of embryo with rather small cells containing a fixed oil; occasional reddish colored fragments of epidermis and underlying spiral tracheae of the mesocarp.

Mix 1 Gm. of powdered *Rhus Glabra* with 10 mls of hot water, shake the mixture occasionally until cold, then filter and evaporate the filtrate spontaneously in a watch crystal; numerous feather-shaped crystals which polarize light strongly with a distinct play of colors, should separate.

The yield of ash does not exceed 4 percent.

#### RUBUS

*Rubus*. Blackberry Bark.

The dried bark of the rhizome of *Rubus villosus* Aiton, *Rubus nigrobaccus* Bailey, or of *Rubus cuneifolius* Pursh (Fam. *Rosaceae*).

In elongated, tough, flexible quills or bands, from 3 to 6 mm. in diameter, the bark 1 to 2 mm. thick; outer surface deep red-brown or dark gray-brown, occasionally blackish-brown, smoothish or somewhat scaly; inner surface yellow or pale brownish, strongly and coarsely long straight-striate; fracture tough-fibrous, readily splitting; inodorous; taste strongly astringent and bitter.

#### RUMEX

*Rumex*.

Yellow Dock. Broad-leaved Dock. Curled Dock.

The root of *Rumex crispus* Linné or of *Rumex obtusifolius* Linné (Fam. *Polygonaceae*), without admixture of more than 5 percent of stem bases and other foreign matters.

Usually split longitudinally or cut into transverse pieces about 2 cm. long. The entire root, nearly simple, slightly tapering, with few if any rootlets, somewhat twisted, up to 30 cm. long and 7 cm. in diameter, externally reddish-brown or grayish from adhering soil, finely annulate above, deeply wrinkled longitudinally, marked with small indented root scars which are often transversely elongated and with occasional stem scars or remains of stem, the latter being hollow and finely striated, leaf buds few obconical; fracture short and dusty, somewhat fibrous.

The transverse section exhibits a yellowish or brownish cortex and a whitish or yellowish

lowish wood which is finely radiate in the outer portion. When viewed with the microscope, it exhibits a thick cortex with several layers of cork, beneath which is an interrupted row of stone cells, a distinct cambium, vascular bundles with few fibers.

The powder when examined with the microscope, shows calcium oxalate crystals in rosette aggregates from 0.025 mm. to 0.060 mm. in diameter; numerous starch grains ellipsoidal or narrowly elongated, sometimes truncate, up to 0.025 mm. in length; stone cells 0.040 mm. to 0.200 mm. in diameter, with walls that are somewhat lamellated 0.008 mm. to 0.025 mm. thick and with few simple pores; sclerenchymatic fibers few, thin-walled with simple pores; tracheæ up to 0.100 mm. wide with scalariform or reticulate thickenings of the wall; cork cells light brown.

On mixing the powder with water and adding a solution of one of the alkalies a red color develops.

The yield of ash should not exceed 10 percent.

#### SALVIA

Salvia. Sage.

The dried leaves of *Salvia officinalis* Linné (Fam. *Labiatae*), without admixture of more than 10 percent of stems and other foreign matter.

Leaves more or less broken; the lamina when entire, varying from lanceolate or elliptical to ovate, 1.5 to 10 cm. in length, summits acute or obtuse, margin finely crenulate, bases rounded or somewhat heart-shaped and with petioles from 1 to 4 cm. in length; upper surfaces grayish-green, densely pubescent in young leaves, the older being nearly smooth; under surfaces light grayish-brown, minutely reticulate and densely pubescent; more or less pliable, velvety; odor balsamic; taste aromatic and bitter. Stems distinctly quadrangular, attaining a length of 14 cm. and a diameter of 3 mm., reddish-brown and more or less pubescent.

**Powder**—Yellowish-gray; examined with the microscope, it shows numerous non-glandular hairs, very long, consisting of from 1 to 6 cells, more or less curved and irregularly bent; fragments of epidermis showing yellow, globular, glandular hairs in which the structure is usually not readily discernible and varying from 0.015 to 0.075 mm. in diameter; glandular hairs of two kinds, either with a unicellular head-cell or with an 8-celled head. Fragments of the stems are

distinguished by the presence of tracheæ with bordered pores associated with narrow, thick-walled, strongly lignified bast-fibers, a few starch-bearing cells of more or less rectangular shape, and large parenchyma cells of the pith having thin, lignified and porous walls.

The yield of ash does not exceed 12 percent.

#### SANTALUM ALBUM

White Sandal Wood.

The heart wood of *Santalum Album* Linné (Fam. *Santalaceae*).

In billets, pieces or chips of varying shapes and sizes, heavy, hard but splitting easily, color light yellow; transverse sections yellow to light reddish-brown, with alternating light and dark concentric zones nearly equal in diameter, with numerous pores and traversed by many very narrow medullary rays.

Under the microscope, sections show the *medullary rays* 2 to 4 rows wide, the cells thick walled and radially marked; the wood wedges consisting largely of wood fibers with pointed ends, large parenchyma and thick walled secretion vessels and cells containing single crystals of calcium oxalate; the oil in globules adhering to the walls of the ducts and parenchyma cells and especially rich in the medullary cells.

Odor characteristic, aromatic, persistent; taste peculiar, strongly aromatic.

The yield of ash does not exceed 6 percent.

#### SASSAFRAS MEDULLA

Sassafras Pith.

The dried pith of *Sassafras variifolium* (Salisbury) Kuntze (Fam. *Lauraceae*).

In sub-cylindrical, often curved or coiled pieces, 2 to 10 cm. in length, 2 to 5 mm. in diameter; very light in weight, externally whitish, occasionally with small fragments of adhering wood; fracture short; a slight odor of sassafras; taste mucilaginous.

Under the microscope, transverse sections of Sassafras Pith, mounted in phloroglucinol T. S. and hydrochloric acid, show that it consists of nearly isodiametric cells with large intercellular spaces, the walls being more or less lignified and provided with numerous, simple pores; mounts made in water show the separation of a thin layer of mucilage from the inner walls of the cells, this being characterized by the gradual disappearance of the pores.

Macerate 0.5 Gm. of Sassafras Pith with

25 mls of cold distilled water for several hours and filter it through cotton; a mucilaginous solution should be obtained which should not show a precipitate upon the addition of an equal volume of alcohol.

### SCUTELLARIA

*Scutellaria*. Skullcap.

The dried plant of *Scutellaria lateriflora* Linné (Fam. *Labiatae*).

About 50 cm. long, smooth; stem quadrangular, branched; leaves opposite, petiolate, about 5 cm. long, ovate-lanceolate or ovate-oblong, serrate; flowers about 6 mm. long, in axillary one-sided racemes, with a pale blue corolla and bilabiate calyx, closed in fruit, the upper lip helmet-shaped; odor slight; taste slightly bitter.

The yield of ash does not exceed 12 percent.

### SODIUM NITRAS

Sodium Nitrate.

It should contain, when dried to constant weight at 100° C., not less than 99 percent of pure Sodium Nitrate ( $\text{NaNO}_3=85.01$ ) and should be kept in well-stoppered bottles.

Colorless, transparent, rhombohedral crystals, odorless, and having a cooling saline, and slightly bitter taste. Hygroscopic in moist air.

Soluble in about 1.1 parts of water, and in about 100 parts of alcohol at 25° C., in 0.6 part of boiling water, and in 40 parts of boiling alcohol.

When heated to 312° C., the salt melts without decomposition. At a higher temperature it evolves oxygen, and is reduced to nitrite. When Sodium Nitrate is heated with charcoal, the mixture deflagrates. To a non-luminous flame it imparts an intense yellow color.

Its aqueous solution is neutral to litmus paper.

If the aqueous solution be mixed in a test-tube with a drop of diphenylamine T. S., and sulphuric acid be carefully poured in, so as to form a separate layer, a deep blue color will appear at the line of contact.

The aqueous solution of the salt (1 in 20), slightly acidulated with hydrochloric acid, should not respond to the U. S. P. Time Limit Test for *heavy metals*.

If to 10 mls of the aqueous solution of the salt (1 in 20) 1 mil of chloroform be added, and then chlorine water which has been

diluted with an equal volume of water be introduced, drop by drop, with agitation, the chloroform should remain free from any violet tint (absence of *iodide*).

Assay—Weigh accurately about 0.4 Gm. of Sodium Nitrate, previously dried to constant weight at 100° C., dissolve it in 10 mls of hydrochloric acid in a small dish and evaporate the solution to dryness on a water-bath. Dissolve the residue in 10 mls of hydrochloric acid and again evaporate it to dryness on the water-bath, continuing the heat until the residue when dissolved in distilled water is neutral to litmus. Dissolve the residue in 25 mls of distilled water, add 50 mls of tenth-normal silver nitrate V. S. agitate well, then add 2 mls of nitric acid and 2 mls of ferric-ammonium sulphate T. S. and titrate the excess of silver nitrate V. S. with tenth-normal potassium sulphocyanate V. S. After deducting from the silver nitrate V. S. consumed the amount which would be consumed by the chlorides present in an equivalent weight of the sample, previously determined as directed by the U. S. Pharmacopeia, the result shows not less than 99 percent of  $\text{NaNO}_3$ .

Each milliliter of tenth-normal silver nitrate V. S. used corresponds to 0.008501 Gm.  $\text{NaNO}_3$ .

Each gramme of Sodium Nitrate, previously dried to constant weight at 100° C., corresponds to not less than 116.457 mls of tenth-normal silver nitrate V. S.

### TAMARINDUS

Tamarind.

The preserved pulp of the fruit of *Tamarindus indica* Linné (Fam. *Leguminosae*).

A pulpy mass of a light reddish-brown color, darkening with age so as to become dark brown, containing some branching fibres and numerous reddish-brown, smooth, oblong or quadrangular, compressed seeds, each enclosed in a tough membrane; odor distinct; taste sweet and agreeably acid.

### TEREBINTHINA

Turpentine.

A concrete oleoresin obtained from *Pinus palustris* Miller and from other species of *Pinus* (Fam. *Pinaceae*).

Turpentine occurs in yellowish, opaque masses, lighter internally, sticky and more or less glossy, brittle in the cold; odor and taste terbinthinate.

It is freely soluble in alcohol, ether, chloroform, and glacial acetic acid.

Its alcoholic solution shows an acid reaction with litmus.

Dissolve about 1 Gm. of Turpentine, accurately weighed, in 25 mls of alcohol, collect the insoluble residue, if any, on a filter which has been dried at 100° C. and weighed. Wash the residue, and filter with about 25 mls of alcohol and dry at 100° C. The weight of the residue should not exceed 2 percent (*mechanical impurities*).

### VIBURNUM OPULUS

*Viburnum Opulus.*

Cramp Bark. High Cranberry Bark.

The dried bark of *Viburnum Opulus* Linné (Fam. *Caprifoliaceae*), without admixture of more than 5 percent of wood and other foreign matter.

In strips, or occasionally in quills or chip-like fragments, the bark attaining a thickness of 3 mm.; outer surface of the thinner pieces of a light gray color with crooked, longitudinal, purplish-brown strips and very small brown lenticels, the thicker pieces purplish-red or occasionally blackish, except when very young, and more or less finely fissured or thinly scaly; inner surface varying in color from yellowish to rusty-brown, with very short oblique striae, except where the outer wood layer adheres; fracture short and weak, the fractured surface mostly whitish, varying to pale brown in the inner layer, rusty brown in the outer layer covering green, tangential, phelloderm plates; odor strong and characteristic; taste mildly astringent and decidedly bitter.

Under the microscope, sections of *Viburnum Opulus* show an outer corky layer, of 5 to 25 rows of cells the walls nearly colorless, frequently thickened on the inner surface, individual cork cells from 0.015 to 0.045 mm. in radial diameter and from 0.030 to 0.075 mm. in tangential diameter; outer bark of about 10 rows of cells containing a brownish-yellow, amorphous substance, small starch grains or chloro-plastids; medullary rays 1 to 2 cells in width, usually not more than 1-cell wide; inner bark with occasional groups of bast fibers composed of 1 to 10 cells, the walls being very thick, non-lignified, lamellated and finely porous; adhering wood with large tracheae having scalariform or reticulate thickenings, and being surrounded by wood-fibers with thick lignified walls;

starch grains, mostly in cells of parenchyma and medullary rays, either single or compound, the individual grains not exceeding 0.006 mm. in diameter; calcium oxalate in rosette aggregates, 0.015 to 0.040 mm. in diameter; numerous fragments of parenchyma cells, the lumina filled with a reddish-brown amorphous substance.

*Powder*—The powder of *Viburnum Opulus* is light grayish-brown, consisting of irregular fragments; cork cells polygonal, with thin, colorless walls; parenchyma with rosette aggregates of calcium oxalate, from 0.015 to 0.040 mm. in diameter; starch grains very small and mostly in parenchyma cells; fragments of parenchyma containing a brownish-yellow amorphous substance; occasional tracheal fragments associated with lignified wood-fibers.

### XANTHOXYLUM FRUCTUS

Prickly Ash Berries.

The dried fruit of *Xanthoxylum Americanum* Miller (Northern Prickly Ash) or of *Xanthoxylum Clava-Herculis* Linné (Southern Prickly Ash) (Fam. *Rutaceae*).

Capsules with short stalks (*X. Americanum*) or without stalk (*X. Clava-Herculis*) when fresh ellipsoidal, fleshy, gray-brown, when dry dehiscent; carpels 2, keeled, apex short pointed, seeds 1 or 2 oblong, black, shining and wrinkled from drying. The carpels have a pungent, warm, aromatic taste and on chewing leave a tingling sensation on the tongue; when breathed upon emits a faintly aromatic odor resembling that of citral.

### ZEA

*Zea. Corn Silk.*

The fresh styles and stigmas of *Zea Mays* Linné (Fam. *Gramineae*).

In slender filaments from 10 to 20 cm. in length, and about 0.400 mm. in diameter; of a light green, purplish-red, yellow or light brown color; stigmas bifid, the segments very slender, frequently unequal and 0.400 to 3.000 mm. in length.

Under the microscope, the styles are seen to consist for the most part of parenchyma and two parallel, vascular bundles with narrow, spiral or annular tracheae; the epidermal cells are rectangular, many of which are extended into multi-cellular hairs, the latter being from 0.200 to 0.800 mm. in length, the basal portion consisting of 2 to 5 united cells,

the upper portion being usually unicellular, the cells of the hairs are rich in cytoplasm and usually contain a small, spherical nucleus; the purplish-red styles contain a purplish-red cell cap.

Digest a small portion of the fresh styles and stigmas in diluted alcohol and filter; a pale purplish-red solution should be obtained, portions of which upon the addition of acids, should become either of a distinct purplish or yellowish-red color, and upon the addition of alkalis of a green color, and with ferric chloride T. S. an olive-green color changing to greenish-brown, and upon the addition of an aqueous solution of alum a bluish or purplish color which is quite permanent.

### ZEDOARIA

#### Zedoary.

The dried rhizome of *Curcuma Zedoaria* Roscoe (Fam. *Zingiberaceae*).

Usually cut into transverse rounded sections, twisted and wrinkled, 1 to 4 cm. in diameter, 5 to 10 mm. thick; externally grayish-brown, hairy, rough, with a few root scars; transverse surface pale reddish to gray-brown; a distinct dark circular endoderm separates the cortex which is 2-5 mm.

wide; the stele contains numerous orange-colored resin cells and irregularly distributed lighter colored wood bundles which are fewer in the cortex. Fracture short, somewhat mealy and waxy; odor aromatic, camphor like; taste aromatic, warm, slightly bitter.

Under the microscope, sections show a thick cork, a thin epidermis with numerous characteristic hairs, thick walled 1- to 6-celled up to 1 mm. long and often thicker in the middle than at the base; the parenchyma of the cortex and of the central cylinder rich in starch; secretion cells isodiametric with suberized walls, contents colorless or yellowish; the endodermis of small, thin walled quadratic cells; the fibrovascular bundles, collateral, more numerous in the central cylinder and nearer the endodermis; few bast fibres in the cortex and no crystal cells.

Powder—Rich in starch, egg-shaped, 0.020 to 0.070 mm. long and 0.007 to 0.012 mm. thick, eccentric, the nucleus in the smaller end; numerous characteristic, thick walled hairs; rich in parenchyma; very few bast fibres and no oxalate crystals or stone cells.

The yield of ash should not exceed 7 per cent.

---

### NEW TEST FOR REDUCING SUGARS IN URINE.

According to W. Cramer (*Journ. Soc. Chem. Ind.*, 1915, p. 579), the test depends on the reduction of mercuric oxide in slightly alkaline solution to metallic mercury. The reagent is prepared by dissolving 0.4 Gm. of mercuric oxide and 6 gm. of potassium iodide in 100 cc. of water, and adjusting the alkalinity of the mixture, by the addition of *N*/10 acid or alkali solution, so that 10 cc. requires exactly 2.5 cc. of *N*/10 acid for neutralization, using phenolphthalein as indicator. To apply the test, 3 cc. of the reagent are heated to boiling, 0.3 cc. of the urine is added, the solution again boiled, and, after the lapse of 30 seconds, acidified with acetic acid. Normal urine containing the usual quantity (0.1 to 0.2 per cent of dextrose) yields a very slight turbidity; when the sugar-content increases to 0.5 per cent a distinct turbidity is produced. The reagent may be made more sensitive by increasing its alkalinity, but the normal quantity of sugar in urine then interferes by producing a turbidity; other substances, such as creatinine, also reduce strongly alkaline mercuric oxide solutions. The acetic acid is added to dissolve precipitated phosphates.—*Merck's Report*.

## Editorial Notes and Announcements

E. G. EBERLE, Editor.....Columbus, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

### REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished reprints by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

- 100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.
- 200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50.
- 50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.
- 100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.
- 200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50.
- 50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.
- 100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50.
- 200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00.

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

## SOME EFFECTS OF SELECTION ON PRODUCTION OF ALKALOIDS IN BELLADONNA.

The above is the title of Bulletin No. 306, U. S. Department of Agriculture Bureau of Plant Industry. The investigations reported in this bulletin cover some effects of the production of alkaloid in belladonna and gives results of a series of tests on controlling pollination. The conclusions reached are stated in the bulletin as follows:

It having been established in the previous investigation that a wide range of variation exists in the alkaloidal content of belladonna plants, the present investigation was undertaken to determine whether the characteristic of alkaloid production is transmissible to the progeny through seed and whether the character is changed by vegetative propagation. The results thus far show that the first-generation plants secured from seed of cross-pollinated selected individuals display the characteristic of the maternal parent with regard to alkaloid productivity. This condition is generally true at all stages of growth during a season and also for at least two successive seasons. Close pollination of the parent plant has shown only a moderate influence on the transmission of this characteristic.

Second-generation plants from cross-pollination have been grown at Arlington, Va., Madison, Wis., and Timmons ville, S. C., and at all three stations they have displayed the relative alkaloid-producing tendencies evident in the original parent plant and the generation preceding.

While the plants at the different localities showed a parallel relationship toward each other, there was considerable difference in the general quantity of alkaloids produced. Thus, in the case of Madison and Arlington, where two pickings were made at fairly corresponding stages of growth, it was found that the Madison plants yielded more alkaloids than those at Arlington. At Timmons ville the yield was still greater than at Madison, but here only one picking was made, and it is hardly possible to make a true comparison. Nothing definite developed to indicate that a relationship exists between the amount of precipitation and sunshine and the percentage of alkaloids produced.

Plants were grown from cuttings, and at two stages of their growth these plants showed a marked tendency to display the same characteristic regarding alkaloid production as the plants from which they were propagated and the original parents of those plants.

## PAN-AMERICAN SCIENTIFIC CONGRESS.

Arrangements have been completed for holding a Pan-American Scientific Congress in Washington from December 27, 1915, to January 8, 1916, in which all of the American republics will participate.

According to the official reports from each of the governments now in the hands of Director-General John Barrett of the Pan-American Union, each one of the twenty-one American republics will appoint delegations composed of its leading educators, economists, engineers, international lawyers, and experts on mining, agriculture, health, transportation and finance. This meeting will signalize an effort to promote closer relations among the American republics along intellectual and educational lines, rather than along political lines. In the same way that the regular international conferences of the American republics have developed closer political ties and the recent Pan-American financial conference helped to promote better financial understanding, so, correspondingly, this congress will bring the Americans more intimately together upon a high plane of intellectual, scientific, educational, and social progress and intercourse.

## MAGNESIUM AND SODIUM SULPHATES IN PLASTER OF PARIS.

The sulphates of magnesium and of sodium have been found in almost all the samples of plaster examined by the author. They are generally present in almost the same proportions and occur in the largest quantity in impure plasters. Their presence has an important influence on the setting of the plaster, markedly hastening the period of hardening. When the proportion in which they occur amounts to only a few parts per thousand, they hasten the period of setting by six minutes, and a few percentages will shorten the time of hardening to one-third of the normal period. In this respect sodium sulphate appears to be more active than magnesium sulphate. These two salts are specially useful for employment in making surgical casts, since they have but slight influence in increasing the temperature of the plaster magma. The introduction of 1 per cent of each salt causes a rise of temperature of only 12° C. When sodium chloride is used for a similar purpose, the increase of temperature is so great that there is danger that the patient may be scalded. F. Canals (*J. Pharm. Chim.*, 1915, II, 286.)

**Book Notices**

**THE PHARMACOLOGY OF USEFUL DRUGS.**—By Robert A. Hatcher, Professor of Pharmacology, Cornell University Medical College, New York, and Martin I. Wilbert, Technical Assistant, Division of Pharmacology, Hygienic Laboratory, U. S. Public Health Service. American Medical Association, 535 North Dearborn Street, Chicago. 1915.

This volume of 457 small 8 vo. pages is a reprint, with additions and changes, of a series of articles published in the *Journal of the American Medical Association* under the heading "Practical Pharmacology."

The presentation of the material in the form of a bound volume constitutes an attempt to interest medical students and practitioners in the uses and possibilities of the more widely used drugs which are generally well established.

The book includes a comprehensive discussion of the pharmacology, the chief therapeutic uses and the *materia medica* or chemical and physical properties of the drugs that have been included by the Council on Pharmacy and Chemistry of the American Medical Association in the "Handbook of Useful Drugs." As an elaboration on this list of drugs the present volume will no doubt be of value to all who are in any way interested in the "Handbook of Useful Drugs" either as a basis for instruction in *materia medica* subjects in medical schools or as a basis for examinations in Therapeutics by State Medical Examining and Licensing Boards.

Hygienic Laboratory Bulletin No. 101; a Digest of Comments on the Pharmacopocia of the United States and on the National Formulary for the Calendar year ending December 31, 1914, is announced in a recently published list of publications of the United States Public Health Service as available for free distribution. Application for this publication should be made to "The Surgeon-General, United States Public Health Service, Washington, D. C." and should specify both the title and number of the document desired. No charge is made for postage. As the number of copies of this publication available for free distribution is limited, members of the American Pharmaceutical

Association and others who may be interested should apply promptly so as to insure the distribution of the Bulletin to persons who will find it of use and value.

#### SCIENTIFIC AND APPLIED PHARMACOGNOSY.—

Intended for the use of students in pharmacy, as a handbook for pharmacists, and as a reference book for food and drug analysts and pharmacologists by Henry Kraemer, Ph. B. (in chemistry), Ph. M. (in pharmacy), Ph. D. (in botany), Professor of Botany and Pharmacognosy, and Director of the Microscopical Laboratory, in the Philadelphia College of Pharmacy; Member of the Executive Committee of Revision of the Pharmacopoeia of the United States of America, Corresponding Member of the Société de Pharmacie de Paris, etc. Illustrated with over 300 plates comprising about 1000 figures. Published by the author, 145 North 10th Street, Philadelphia.

This handsome, large 8 vo. of 837 pages is now available as the companionbook to the volume on Applied and Economic Botany published by the same author some months ago.

In the preface to the present volume the author very properly asserts that because of the role played by vegetable substances in the treatment of disease pharmacognosy takes rank as one of the most important divisions of applied botany. The training for this study is fundamentally botanical and the technique employed is essentially that of the plant morphologist, physiologist and taxonomist. The preface further states that the domain of pharmacognosy, because of the diversity of interests, is one of the most fascinating studies that can engage the attention of pharmacists.

It would be difficult indeed for anyone at all interested in pharmacy or any one of the many related studies to review the text and the many handsome illustrations in this volume on scientific and applied pharmacognosy without appreciating the truth of the statements made by the author in the preface as quoted above. The nature, composition, origin and romance of drugs are emphasized in this book in a way that must appeal to all who are either directly or indirectly interested in drugs and their uses. A natural classification has been adopted and the plants and drugs mentioned are grouped according to "Die natürlichen Pflanzenfamilien" of Engler and Prantl, now generally followed by writers on botany. The

book also includes a chapter on powdered drugs and a key for the study of powders. Reference is made easy by a comprehensive index of 20, three column, pages containing more than 3300 references.

M. I. W.

WINDOW DISPLAY FOR DRUGGISTS.—By Harry B. Mason. Third Edition. E. G. Swift, Detroit, Mich.

The very fact of a third edition of a pharmaceutical book is noteworthy, and shows that the efforts of the author were well appreciated by those for whom the book was written. Mr. Mason has a remarkable gift of recognizing the practical wants of the everyday druggist, and understands how to supply a remedy for certain pharmaceutical ailments that others overlook, or consider of no account. The importance of proper window displays must be apparent to every observer who strolls through the streets of a big city and keeps his eyes open. It is nothing unusual to see placards of a cough syrup that were put in the window in the Spring, covered with fly specks in August; or others that announced insect destroyers in Summer, remain there till Christmas. There certainly is a need to call certain negligent druggists to order, teach them the use and value of attractive displays, and give them suggestions on the subject of window dressing in general. The third edition of this useful little book has added thirty-two descriptions and engravings of new trims to the former ones and is a living testimonial of the skill and good judgment of the author. The publishers also deserve credit for the neat and attractive typographical execution of the volume.

W. C. A.

COLLECTED PAPERS FROM THE RESEARCH LABORATORY.—Parke, Davis & Co., Detroit, Mich. Dr. E. M. Houghton, Director. Reprints. Volume 3, 1915.

This volume of 341 large 8 vo. pages contains reprints of 22 original communications of pharmaceutical and pharmacologic interest.

Among the papers that are largely pharmaceutical, it will suffice to enumerate: U. S. P. Menstrua, by H. C. Hamilton; The Sterilization of Adrenalin Solutions, by L. W. Rowe; Disinfection and Disinfectants, by H. C. Hamilton; the Bacteriological

Standardization of Disinfectants, by H. C. Hamilton; The Pharmacy of Adrenalin, by C. P. Beckwith. These and the other papers in this volume contain much that is of value in addition to the subject matter announced in the titles. This varied information could be made more readily available by appending a more or less comprehensive index to the individual volume or better still by compiling in connection with a future volume an index to the material already published. Even as they are these reprints constitute an important contribution to the literature on the properties and uses of drugs that should be known to all who are in any way interested in pharmacology or related branches.

M. I. W.

## Obituary

### GEORGE D. FELDNER.

George D. Feldner, senior, sixty-one years old, died recently in New Orleans, where he had been engaged in the drug business for forty-five years. During the scourge of 1878, Mr. Feldner, then a young druggist, volunteered his services as druggist to the cause and gave freely of his time and means.

In the death of Mr. Feldner, New Orleans loses one of its oldest and best known druggists. He typified the southern gentleman of the old school, a man who was ever gentle and kind to those with whom he came in contact and who, on account of his genial disposition, numbered friends in all the walks of life. To the poor he was most kind, and without ostentation, gave them such assistance as he could.

He became a member of the Board of Trustees of the New Orleans College of Pharmacy a few weeks after its organization, and his devotion to the institution was most loyal, being a constant attendant at all its meetings except when sickness prevented. For thirteen years he was the President of the College and his services at all times, especially when the institution needed them most, were most valuable.

He became a member of the American Pharmaceutical Association in 1913.

At the time of his demise, Mr. Feldner was a member of the Democratic State Central Committee, and a prominent Mason, Pythian and Druid, and an honorary member of the Washington Artillery.

He is survived by his wife, one son and two daughters.

### G. H. CHAS. KLIE.

G. H. Chas. Klie, as he was familiarly known, died at his home in St. Louis, September 24, 1915, in his seventieth year. Cancer was the immediate cause of death. He was born in Germany in 1845 and came to this country as an orphan, at an early age. An uncle who cared for him intended to educate him for the clergy. He, however, drifted into pharmacy. He was located at 5100 North Broadway, St. Louis, for more than forty years. Although much interested in pharmacy, he studied medicine about twenty years ago and soon had a good practice which was carried on in connection with the drug business.

Dr. Klie belonged to the old German type of pharmacist of which he was one of the very last remaining in St. Louis. He was for years secretary of the Mo. Ph. A. and always interested in the A. Ph. A., of which he became a member in 1878. He was a life member of the St. Louis College of Pharmacy and served as secretary for several years. He was for ten years assistant secretary of the United States Pharmacopoeial Convention. His contributions to pharmacy were always instructive and practical. A case he reported to the St. Louis Medical Society caused very favorable comment not only on account of the very careful study which Dr. Klie had given the subject but the very clear and concise manner in which he described the disease and explained his conclusions.

As a citizen and Christian gentleman, Dr. Klie measured up to the highest standard.

Among the active pall-bearers were Messrs. Francis Hemm, Robert E. Schneter and H. M. Whelpley, of the St. Louis College of Pharmacy.

H. M. W.

## Societies

### PHI DELTA CHI FRATERNITY CONVENTION.

The sixteenth annual Grand Council of the Phi Delta Chi Fraternity was held in San Francisco August 12th, 13th and 14th, simultaneously with the convention of the American Pharmaceutical Association. The objects of the fraternity are to advance the sciences of pharmacy and chemistry among college men and to foster and promote a fraternal spirit among its members.

Among the delegates representing the various chapters were the following: Dean W. J. Teeters of the State University of Iowa; Caswell A. Mayo and Dr. Geo. Diekman of New York; Azor Thurston, State Chemist of Ohio; Mr. R. A. Lyman and Mr. Niels P. Hansen of the University of Nebraska; Dean Wulling, Prof. E. L. Newcomb, Mr. I. H. Robitshek and Mr. Peterson of the University of Minnesota; Dean C. W. Johnson of Seattle; Mr. Fox of Columbus, Ohio; Prof. E. H. La Pierre of Boston; Prof. Poe of University of Colorado; W. G. Gaessler of the Iowa State College at Ames; and Dr. Hayden M. Simmons and many others of the University of California.

In addition to many other matters of importance accomplished during the meetings, a scholarship prize to be known as the "Azor Thurston Scholarship Prize" was established and as a result the active chapter of the fraternity having the highest average grade in his studies for the year will be awarded \$25 in cash. Also a silver loving cup to be known as the A. B. Prescott Scholarship Cup will be presented to the chapter ranking highest in scholarship. Any chapter winning this cup three times may keep it permanently.

The following national officers were elected for the ensuing year:

Azor Thurston, Grand Rapids, Ohio—Grand President.

J. C. Buckner, Galveston, Tex.—Grand Vice President.

W. G. Gaessler, Ames, Iowa—Grand Secretary.

F. F. Ingram, Jr., Detroit, Mich.—Assistant Grand Secretary.

Niels P. Hansen, Lincoln, Neb.—Grand Treasurer.

Edward Spease, Columbus, Ohio—Grand Editor.

The next Grand Council will be held in Minneapolis in February, 1916.

### THE TAXES ON TOILET ARTICLES.

We publish the following letter because it has an interest for retail druggists and in order that such action as may be deemed necessary may be taken. Some thoughts are embodied and emphasized that are deserving of consideration.

*To Our Friends In the Trade:*

The recent utterances of the Secretary of the Treasury, that it is the purpose of the administration to ask Congress to continue the present Emergency War Revenue Act until the conclusion of the war in Europe, causes us to bring to the attention of the trade and the American people generally the great injustice of the tax on perfumes and other toilet preparations levied under the aforementioned act.

It is inconceivable that Congress, when placed in possession of the facts, will continue the imposition of a tax that is not only inequitable, but likewise so contrary to the express intent of its authors, in that it is not a tax on the *consumers* of luxuries, but a tax on the *manufacturers* and *retail dealers* in these articles.

The wording of the Emergency War Revenue Act makes it practically impossible to pass the tax on to the consumer. How can one-eighth or one-quarter of a cent be added to the retail price of an article without either splitting a cent into fractional coins or else multiplying the tax to the consumer in order to make it a full cent. This injustice the consumer would be sure to resent and to nullify by an appeal to trade competition, thus saddling the tax on the *retailer*.

Taking the expressed intention of Congress, that the tax levied according to Schedule "B" of the Emergency War Revenue Act is a tax on the *consumer* of luxuries, the injustice of the tax is immediately apparent in these enlightened days of sanitation and hygiene, by the inclusion in the list of taxable articles of such absolute necessities of modern civilized life as perfumery, dentifrices, talcum powders, deodorants, mouth washes, cold creams and hair tonics.

If these articles are to be classed as luxuries, why not include all other luxuries in the list? Why arbitrarily single out for special and discriminatory taxation the manufacturers, or dealers in one class of questionable luxuries, and leave the great mass of unquestioned luxuries untaxed?

Under existing conditions, no possible excuse exists for this form of taxation. Were this country at war, we would cheerfully contribute to the requirements of any emergency situation. But, we are at peace with all the world, and a proper revenue system would most certainly make adequate provision for the financial necessities of the Government.

But even conceding for the moment that our industry is properly the subject of discriminatory taxation: what defense can be found for an arbitrary tax that takes no heed of our incomes, profits or losses, but that demands a huge daily tribute, even though it involves a great financial loss to us, or as an alternative, demands that we pass the burden along to the retailer.

Let us see just what this tax means. A tax of one-eighth of a cent on a 5-cent article at retail is  $2\frac{1}{2}$  per cent, or on the manufacturer's average price of  $2\frac{1}{2}$  cents for a 5-cent article, 5 per cent. This tax of 5 per cent runs through the entire series of 5, 10, 15-cent and other retail prices.

this enormous tax, imposed in the face of war conditions in Europe which have greatly increased the cost of raw materials for perfumes and other toilet preparations, is levied regardless of whether the manufacturer is making or losing money. To all of us, the payment of this tax is proving an intolerable burden, and to many of the most reputable and worthy members of our industry it means downright confiscation.

The manufacturer doing a business of \$250,000 a year considers himself fortunate if his net profits, exclusive of the war tax, are 10 per cent, or \$25,000 a year. Now, however, the Government steps in and appropriates 5 per cent of the business total, or \$12,500—just 50 per cent of his net earnings. But this is not the worst of it. If the business should for any reason show a loss of \$25,000 a year, the Government would nevertheless exact from the unfortunate manufacturer the identical tribute of \$12,500.

As manufacturers in the industry thus

assailed, we enter our solemn protest to the National Government and the American people. If the tax is reimposed at the coming session of Congress, we shall have to determine for ourselves individually the expediency and necessity, as a measure of self-preservation, of passing the burden along to the retailer, who, it is hoped, will find a way to combat or escape the severity of the tax. It is hoped that this necessity will not be forced upon our industry, and we therefore urgently appeal to our friends in the retail trade to aid us in bringing the facts before the attention of Congress.

We repeat: there is not a shadow of reason why we should be made the exclusive victims of discriminatory taxation. We ask no favors. But, we do demand the same measure of justice that is extended to all other legitimate industries.

No other American industry, we contend, yields to the Government a 700 per cent tax on alcohol; a 20 per cent increase in the tariff on its raw materials; a corporation and income tax, and a present tremendous increase in the cost of its raw materials, besides an increased custom tax derived from this increased cost of these raw materials.

As to the foregoing, we have entered no open protest or complaint. But when on top of these contributions to the National Revenue, a far greater tax is to be again indefinitely imposed on our business, a sense of self-respect forbids that we remain silent.

A. M. SPIEDLER,

President, The Manufacturing Perfumers' Association of the United States, 309 Broadway, New York City.

<>

#### COMMITTEES NATIONAL WHOLESALE DRUGGISTS' ASSOCIATION.

President Charles Gibson, of the National Wholesale Druggists' Association, has announced appointments of the committees to serve during the ensuing year, the names of each chairman being given, as follows:

Commercial Travelers—Henry D. Faxon, Kansas City, Mo., Faxon & Gallagher Drug Co.

Credits and Collections—R. R. Ellis, Memphis, Tenn., Hessig-Ellis Drug Co.

Drug Market—C. L. Hunsling, New York.

Employers' Liability—C. W. Whittlesey, New Haven, Conn., the Chas. W. Whittlesey Co.

Fire Insurance—C. E. Bedwell, Omaha, Neb., E. E. Bruce & Co.

Legislation, Geo. W. Lattimer, Columbus, Ohio, Kauffman-Lattimer Co.

Local Associations, C. S. Martin, Nashville, Tenn., Spurllock-Neal Co.

Membership—G. Barrett Moxley, Indianapolis, A. Kiefer Drug Co.

Memorials—H. J. Schnell, New York, Oil, Paint and Drug Reporter.

Prevention of Adulteration—C. Mahlon Kline, Philadelphia, Smith, Kline & French Co.

Proprietary Goods—W. P. Ritchey, New York, Bruen, Ritchey & Co.

Rates and Routes—Chas. E. Matthews, Chicago, Ill., Sharp & Dohme.

Trade-Marks—E. K. Hyde, Buffalo, N. Y., Mentholatum Co.

Transportation—A. H. Van Gorder, Cleveland, Ohio, Hall-Van Gorder Co.

Suits—W. Jay Schieffelin, New York, Schieffelin & Co.

Paints, Oils and Glass—Nelson P. Snow, Syracuse, N. Y., C. W. Snow & Co.

<>

## STEVENS BILL INDORSED BY NEW YORK RETAILERS.

About 300 retail merchants, representing practically all branches of trade in Greater New York, gathered at the Hotel Astor on October 27 to discuss ways and means for bringing about the passage of a price maintenance measure at the next session of Congress.

Dr. W. C. Anderson, chairman of the Conference of Independent Retailers of the Metropolitan District, Inc., under whose auspices the meeting was held, called the meeting to order and introduced the speakers of the evening.

Dr. Lee Galloway, professor of commerce and industry at New York University, spoke of the social and economic foundation underlying the price maintenance idea. He stated that nearly all evils in merchandizing could be traced back to price-cutting.

He pointed out that retail merchants generally regarded trade-marked and proprietary articles unfavorably and made little effort to sell them because of the prevailing cut prices. It would, therefore, be to the interest of the manufacturer as well as to the retailer if a set price were maintained. Looking at it from the consumer's point of view, Professor Galloway said that while the argument might be advanced that maintained

prices would mean greater outlay for some articles by the public, the doing away with advertised sales of standard articles at cut rates in order to coax people into an establishment and then sell them something else on which a huge profit is made would by far overshadow this objection.

Samuel C. Henry, chairman of the Legislative Committee of the N. A. R. D., said that the success of legislation covering price maintenance depended on the amount of energy put behind the Stevens bill by the retailers. He guaranteed the support of the organization which he represented in bringing about the passage of this bill.

Dr. Anderson made a plea for co-operation on the part of all retail merchants in protecting their individual interests. He urged the retailers to see their Congressmen and place before them the arguments for the necessity of price maintenance.

Before adjournment was taken, resolutions were adopted indorsing the Stevens bill and protesting against the unfair methods used to oppose its passage. These resolutions were ordered to be sent to the President, all members of both houses of Congress, all members of the Federal Trade Commission, all members of the State legislature and to the Governor.

<>

## RECIPROCAL REGISTRATION FOR PHARMACISTS ESTABLISHED WITH THIRTY-SIX STATES

Interchange of Certificates Becoming Universal.

Registered Pharmacists who are registered by examination with certain grades and other qualifications in any of the 36 "active" member states of the National Association of Boards of Pharmacy may now secure registration by reciprocity to any other member state of the Association. The official application with instructions for executing and filing the same, may be obtained from H. C. Christensen, Secretary N. A. B. P., No. 450 Bowen Avenue, Chicago, Illinois, by remitting the required fee of \$5.00. Also any inquiry regarding reciprocity will receive prompt attention. The list of active and associate members follows: Active: Alabama, Arkansas, Arizona, Connecticut, Delaware, District of Columbia, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri,

Montana, Nebraska, New Hampshire, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, West Virginia, Wisconsin.

Associate: Colorado, New York, North Carolina, Pennsylvania.

While extending reciprocal registration is one of the objects of the N. A. B. P., that Association has other and, perhaps, more important functions—some of which might be mentioned:

(a) Higher standards of education both as regards preliminary and college education.

(b) More uniform examinations by Boards of Pharmacy—based on minimum standards of Pharmaceutical education and uniform legislation.

(c) Placing the Association on a financial basis that will enable it to render to members, schools, etc., the highest degree of service.

Decidedly better conditions are being brought about with reference to some of these conditions by the tendency to closer coöperation between those who teach pharmacy and those who pass final judgment on candidates for registration as pharmacists.

### Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

#### BALTIMORE.

Minutes of the October meeting, Baltimore Branch, American Pharmaceutical Association, held in the Assembly Hall of Hynson, Westcott & Company's Pharmacy, S. E. corner Charles and Franklin Streets, Wednesday, October twentieth, Nineteen Fifteen, at eight p. m.

The notice of the meeting read: As this is to be the first meeting after the summer recess, it is to be more in the nature of an autumn rally. During this recess, the meeting of the parent association has been held, as well as those of the other pharmaceutical bodies and the Baltimore delegates to these meetings are full up to overflowing with enthusiasm, information and ideas and they are to be with us and are to share them with us, so that the coming meetings should be the best in the history of the Baltimore Branch. Some of the delegates are too modest to allow their names to appear on the program, so all the names have been withheld and as there are other things besides those strictly pharmaceutical to be told after a trip from ocean to ocean this meeting should be a rally, not only for pharmacy, but also for our glorious country.

In the absence of the president, Mr. Hodson, Mr. Robert S. McKinney was called to the chair and he presided.

Dr. Engelhardt, who was to have reported, telephoned his inability to be present as visitors from a distance had unexpectedly arrived at his home and he would have to withhold his remarks for a later meeting.

During the different accounts of the meeting in San Francisco, it was brought out that Maryland was very well represented and in proportion to its membership was the best represented of the eastern states.

Six members of the Branch were present; one of the members took his family along, and one member went all the way to Alaska.

Mr. McCarthy of the New York Branch, who is an ex-Baltimorean, was also present on the coast and was likened to the title of Otis Skinner's play at one of the local theatres, in that he seemed to be the "Cock of the Walk."

There was a little criticism of the editing of the accounts of the meeting in that some of the names of those present were misspelled, Miss Cole appearing under the aliases of Cote, Kohl, *et cetera*.

The attendance, to those who have been used to larger meetings in the east, seemed small, but when the distance from the great centers of population was considered, along with the work done, put in shape and planned for the future and when it was realized that the results of the deliberations will be manifested in progress in pharmacy and result in enactments by congress and the legisla-

tures, the meeting was a good one and a great deal was accomplished.

The report of the Commission on Proprietary Medicines was considered at length and was thought to be a step in the right direction and credit should be given to J. H. Beal for his untiring work along these lines.

It was brought out that Mr. Hover of the National Association of Wholesale Drug-gists reported that after thorough investigation in a number of cases that 13½ per cent was the average profit on prescriptions in the ordinary stores and places were actually losing money on their investments in stock.

Dr. Engelhardt's report as chairman of the Scientific Section was lauded and Mr. Lowry's paper on "A Seven-Barrelled Moth Ball Sale," read before the Commercial Section, was commended.

The right and wrong ways of advertising were commented on and it was brought out that in West Virginia the laws were such that a concern was fined for advertising as pure wool, clothing that was a mixture of wool and cotton, and that pure advertising is practically as necessary as pure food and drugs.

The number of women in pharmacy in the west surprised some and was contrasted with conditions in the east where they seemed to be limited to the hospitals and dispensaries.

The fearful and wonderful manner in which some kind of a hybrid mixture of pharmacy, medicine and superstition is conducted in the oriental drug stores in Chinatown caused smiles and horror and afforded amusement.

The banquet was considered the most hilarious in the memory of the oldest delegate and although there were various hints as to the Zone at the exposition, the tales that could be told about it were reserved for another occasion.

Mr. Frames reported for the National Association of Boards of Pharmacy that the word had gone forth that for 1920 high school education and graduation in pharmacy were planned as preliminaries to registration.

Mr. Lowry, in discussing the idea of a line of proprietary medicines trade-marked by the Association and manufactured by the pharmacist, stated that he had intended writing a paper on the subject, but had gotten no farther than the unthreaded notes and expressed it as his individual opinion that, if

the Association did act in the matter, it would be better to have the manufacturing end done by the large concerns, the pharmacist doing the selling only, somewhat along the lines of the imprint goods now carried by so many stores, but with the exception that every member of the Association would push the same line and get the benefit of concerted action and advertising.

Among those who took part in the meeting were Miss Cole, Messrs. Caspari, Frames, James F. Hancock, Hynson, Lowry, McKinney, Meyers, Neal and Schultze.

WM. J. LOWRY, JR.,  
Secretary.

<>

#### PHILADELPHIA.

The regular monthly meeting of the Philadelphia Branch of the American Pharmaceutical Association was held Tuesday night, October 12th, at the Philadelphia College of Pharmacy.

The meeting was called to order at 8:30 and, there being no new or unfinished business, the program was taken up at once.

Dr. Wilson W. McNeary presented "A New Method for the Preparation of Milk of Magnesia." The paper raised considerable comment and, after a lengthy discussion, during which Prof. E. F. Cook suggested that some volatile oil should be added to milk of magnesia to make it more palatable, Prof. LaWall moved the method as given by Dr. McNeary, with Prof. Cook's suggestion, be referred to the proper sub-committee of the U. S. P. revision committee, having that work in charge. The motion was seconded and, when put to vote, carried.

Dr. Adolph W. Miller gave a very interesting and instructive account of his impression of the Pacific Coast, the California fairs and of the convention of the National Wholesale Drug Association.

After a somewhat brief discussion of the Harrison Act, the meeting adjourned.

J. ED. BREWER,  
Secretary.

<>

#### NASHVILLE.

The Nashville Branch of the American Pharmaceutical Association met in joint session with the National Drug Club in the Music Room of the Nashville Y. M. C. A., Thursday, October 21st, President D. J. Kuhn of the Nashville Drug Club presiding.

An address was delivered by State Pure Food Inspector Harry Eskew, in which he reviewed the work accomplished by his office since last July. He asked the earnest co-operation and moral support of all in the enforcement of the seven different laws for which he is responsible, and promised that everyone would be given lawful consideration.

Mr. F. W. Ward, of Memphis, representing the Board of Pharmacy, then in session here, spoke of the druggists' responsibility in the enforcement of anti-narcotic and other pharmacy laws and urged druggists to have manhood enough to report violations coming within their knowledge.

William R. White was then called on and made a plea for law enforcement, after which he read a paper entitled "Some Pharmaceutical Notes," which related some of his recent experiences in wholesale manufacturing.

A communication was read from the Secretary of the Fair Trade League advocating the passage of the Stevens Bill in Congress. A motion was passed endorsing the measure and a committee appointed to present the claims of the bill to Tennessee congressmen and senators.

A committee was also appointed to confer with members of a local medical society with reference to a resolution recently adopted by them, threatening to boycott certain druggists.

Dr. J. O. Burge then spoke of the activities of the American Pharmaceutical Association.

WILLIAM R. WHITE, Secretary.

#### SAN FRANCISCO.

The San Francisco Branch of the American Pharmaceutical Association met on Tuesday evening, October 12th, 1915. In the absence of President Schneider, Vice President Jennie M. White presided. The minutes of the September meeting were read and approved.

The report of the program committee was received. The committee approved of the suggestion of Mr. England that a review of the current literature be made a regular feature of the meetings of the various branches. The members assigned the journals to be reviewed and seemed very enthusiastic in this work.

The treasurer reported a surplus in the treasury and showed that the branch was fairly prosperous.

Mrs. Harry Low read a paper on the use of iodine in surgery and called special attention to the solution in benzine which many surgeons are now using. Because of the expense of alcoholic solutions and of the discoloration of the skin benzine is desired. Benzine, likewise has its objections in its unpleasant odor and inflammability. In the discussion which followed there seemed to be a doubt whether the surgeon desires a solution of crystal iodine in benzine or 1½% of the tincture. The writer mentions the difficulty experienced in dissolving the crystal iodine in the benzine.

Writing inks were also discussed. The paper was postponed to a later date. The scarcity of drugs and chemicals and the resulting increase in prices were mentioned and this informal discussion closed a very interesting meeting.

The November meeting will be held on the ninth at 723 Pacific Building, at 8 o'clock.

CLARISSA M. ROEHR,  
Secretary.

#### NEW ENGLAND.

The annual meeting and election of officers of the New England Branch of the American Pharmaceutical Association was held on Wednesday evening, October 13, 1915, at the Crawford House in Boston.

The following officers were elected for the ensuing year:

President—Fred W. Archer, Milton, Mass.

Vice President—William H. Glover, Lawrence, Mass.

Secretary-Treasurer—R. Albro Newton, Southboro, Mass.

Chairman Professional Relations Committee—Frank F. Ernst, Jamaica Plain, Mass.

Chairman Membership Committee—Carlton B. Wheeler, Hudson, Mass.

After the business meeting the Branch joined the Boston Association of Retail Druggists in listening to Deputy Collector John N. O'Donahoe, who spoke on the rulings of the U. S. Treasury Department in enforcing the Harrison Act. Considerable discussion followed.

R. ALBRO NEWTON,  
Secretary.

## CINCINNATI

The Cincinnati Branch, American Pharmaceutical Association, opened the session 1915-16 by holding its first meeting at the Metropole Hotel, Friday, October 29th, 1915. The meeting was preceded by an elaborate luncheon, which was attended by most of the Cincinnati members, as well as a number of out-of-town guests, notably Dr. J. H. Beal, Urbana, Ill.; Charles H. Avery, Chicago, Ill.; Walter Rothwell, Hathoro, Pa.; J. G. Heinritz, Holyoke, Mass., and others.

After a short business session, President Charles G. Merrell introduced the principal speaker of the evening, Dr. J. H. Beal, who in his usual happy and convincing style, gave a very interesting talk on the progress and results of the administration of the Harrison Anti-Narcotic Act, as well as the general progress of pharmacy. Dr. Beal is the author of the Beal Local Option Law of Ohio, as well as one of the framers of the Harrison Anti-Narcotic Law, and his remarks are therefore considered authentic.

The speaker said we should not be everlastingly tearing up the statutes and bothering the public with propositions for new legislation, without first enforcing the old laws. He advises that the State narcotic laws conform with the Federal laws. He speaks in favor of rational temperance and rational anti-narcotic legislation. Regarding a certain class of preparations containing narcotic drugs and alcohol, which he held were between legitimate and illegitimate medicinal preparations, he said they should not be classed with one or the other, but that the purpose of the sale should be to determine the legality of the transaction. Drug fiends, for example, would take big chances by taking cholera mixtures or corn collodion, containing Cannabis Indica, still narcotics of this class are intended to be included in the illegal list by proposed new legislation. Some go so far as to exclude any liquid containing alcohol on the presumption that alcohol may be regained by distillation and possibly be used as an alcoholic beverage. Such absurd legislation would of course affect all fluid-extracts, tinctures, essences carried by the legitimate drug trade. It is also proposed to include chloral, all the bromides and a number of other valuable drugs on the proscribed list.

The speaker advises that no legislation be

advocated that interferes with the interests of the legitimate druggist or physician, and that legislators should not listen to fanatical reformers. Seek out the real criminal, condemn him, but do not condemn the whole community. Too much legislation interferes with the legitimate uses of alcohol and narcotic drugs, but rational legislation, such as the Harrison Act demands for the regulation of the sale of dangerous and habit-forming drugs, is generally advocated and commended by the druggists, and it is greatly due to the efforts of, and gives great credit to the American Pharmaceutical Association, that this law has been placed on the Statute Books of our country.

CHAS. A. APMEYER, Secretary.

## DETROIT.

The Detroit Branch of the American Pharmaceutical Association met at the Wayne County Medical Society Building, Friday evening, Oct. 15th, a good attendance being present.

The program consisted of some very interesting papers and discussions on prescription pricing. The subject was gone into very thoroughly in the papers read by Mr. Harry B. Mason, Mr. Chase and Mr. Stewart.

The general opinion seemed to favor the Evan's rule for pricing prescriptions with some exceptions, such as a well known proprietary like Maltine or a small inexpensive prescription like an eye lotion.

A. A. WHEELER, Secretary.

## CHICAGO.

The first monthly meeting of the Chicago Branch of the American Pharmaceutical Association was held Tuesday evening, October 18th with an attendance of 150 pharmacists and students of pharmacy.

The discussion of this evening centered about the Illinois State Board of Pharmacy Examinations. Leo. L. Mrazek, Frank J. Butler and Wm. J. Clancy, members of the Board of Pharmacy addressed the meeting, presenting the scope of the examinations, the nature of the questions asked and the why and wherefore of this legal testing of the knowledge of candidates for the profession of pharmacy.

Teachers and prominent pharmacists re-

plied. Among those who spoke were Professors W. B. Day, C. M. Snow, A. H. Clark of the University of Illinois School of Pharmacy; Professor C. W. Patterson, of Northwestern University School of Pharmacy; Professor G. L. Secord, of Loyola University School of Pharmacy; Secretary T. H. Potts, of the National Association of Retail Druggists; Secretary I. M. Light, of the Chicago Retail Druggists Association; Secretary H. C. Christensen, of the National Association of Boards of Pharmacy and Patrick Coffey, vice-president of the Chicago Drug Clerk's Association.

Mr. Mrazek stated that of the six divisions of the examination, namely, pharmaceutical arithmetic, written materia medica, pharmacy and chemistry, the oral quiz and the prescription compounding, in his opinion the pharmaceutical arithmetic was equal in importance to the others. Of the 10 questions of this examination, two were commercial problems, two chemical problems, two specific gravity or specific volume problems, two in percentage and two in alligation.

Three points were prominently presented in the discussion and tacitly endorsed by the meeting. First, the absolute need in every state of a strong, properly-conducted examination to determine the fitness of the candidate to enter pharmacy. Second, the great desirability of the pre-requisite, i. e. a thorough training in a suitable systematic course of study in a school or college of pharmacy before admission to the State Board examination. Third, the importance of adequate preliminary education before admission to the school of pharmacy. Mr. Christensen stated that the only safety for the profession of pharmacy lies in raising the standard of pharmaceutical education. He earnestly desired and expected that by 1920 the colleges of pharmacy would require a high school education for admission to their classes and that boards of pharmacy would require college graduation for admission to their examinations.

The Illinois Board of Pharmacy Examinations were as a rule highly commended. The scope of their examinations has been adopted by many other states. Criticism was made against the type of question that is not directly applicable to the U. S. P. or N. F. That is, questions in botany and plant histology should test the candidates knowledge of the botanical and histological terms used

in U. S. P. or N. F. The same holds true for questions in theoretical and analytical chemistry and theoretical pharmacy.

E. N. GATHIERCOAL, Secretary.

<>

#### PITTSBURGH.

The initial meeting of the Pittsburgh Branch of the American Pharmaceutical Association for the season of 1915-16 was held at the College of Pharmacy, Friday, October 15th at 8 p. m. The programme as announced was "Proposed Wood Alcohol Legislation." The discussion to be opened by Dr. Louis Emanuel.

The opening pronouncement made by Dr. Emanuel was that under the Poison Law of Pennsylvania wood alcohol is not a poison according to the definition set down therein. Physiologically ethyl alcohol, as well as methyl alcohol, are considered to have toxic properties; of the two, the latter is regarded as the most potent, it is regarded as so potent that legislation for a proper regulation of its sale seems desirable.

Referring to action taken at the 1915 meeting of the A. Ph. A. on this subject a certain type of label was recommended for general adoption for wood alcohol containers, a portion of the wording being, "It is unlawful to use this fluid in any article of food, beverage or medicinal or toilet preparation, intended for internal or external use." Now, said Dr. Emanuel, this label looks all right, but it is not truthful, in the statement that its use is unlawful in toilet preparations, at least in Pennsylvania, for the reason that this State has no law on the subject. The Pennsylvania Food Act of 1909 prohibits the use of "Alcohol or any other ingredient deleterious to health" in any food, or article that is used in the preparation of any food. It considers food to include beverages, hence so far wood alcohol is tabooed, but not so in toilet preparations.

Dr. Blumenschein said he had interviewed the coroner on the subject who said there had never been a case of wood alcohol poisoning brought to the attention of his office during his incumbency covering a number of years.

Dr. Darbaker said the use of wood alcohol in hat making industry is common and many workmen have become blind from its effects. He presented an article on the subject contained in a magazine in which one hundred cases were cited of deaths and blindness.

Dr. Blumenschein said there are a number of States in which no record is kept, hence the number of deaths as officially reported could have but little bearing as a whole.

Dr. Saalbach cited personal experience with a refined wood alcohol, the label upon which claimed it to be non-poisonous and commended its use in the preparation of external remedies such as tincture of iodine, etc. Later this misstatement having been called to the attention of the manufacturers, the wording of the label was changed.

The ordinance effective in New York City was commended and on motion of Dr. Julius A. Koch the Branch adopted a resolution advising that an effort be made to have legislation in accord therewith adopted generally.

Dr. Wurdach exhibited by blackboard illustration a method in use by him in the post-graduate course of the Pittsburgh College of Pharmacy for producing methyl alcohol which proved a very interesting and instructive demonstration.

B. E. PRITCHARD, Secretary.

### The Pharmacist and the Law

#### RULING UNDER HARRISON LAW SUSPENDED.

The ruling contained in the first paragraph of Treasury Decision No. 2244, requiring the quantity of narcotic drug to the ounce or if in tablet form, the total number of tablets, and the quantity in grains per tablet to be indicated on the official narcotic order forms, is hereby suspended until January 1, 1916, in order to give manufacturers, dealers and other persons who make use of these order forms, an opportunity to adjust themselves to the changed conditions necessitated by the treasury decision referred to.

The second paragraph of Treasury Decision No. 2244, relating to the signing of narcotic order forms, is not suspended.

<>

#### NEW YORK WHOLESALE DRUGGISTS TO OBSERVE N. Y. HEALTH BOARD'S FORMULA DISCLOSURE ORDINANCE.

Eleven New York drug jobbers go on record as willing to comply with the ordinance

forbidding handling of proprietary medicines unless registered with Health Department—Also indorse federal legislation of similar character.

Seemingly reconciled to the idea that legislation of a national as well as of a local character, to compel the disclosure of qualitative formulas and the registration of all proprietary medicines is close at hand, several leading representatives of the wholesale drug trade of New York City have placed themselves on record, in a letter to the Commissioner of Health, as favoring a federal enactment regulating the sale of such goods, in addition to signifying their intention of complying with the local Health Board's ordinance on this subject.

This action on the part of some of the wholesale drug houses in New York City, whereby they have pledged themselves to observe the provisions of Section 117 of the local Sanitary Code, which becomes effective December 31, without interposing any objection to their enforcement, follows closely upon a similar submission to this local ordinance on the part of the New York Pharmaceutical Conference, representing the retail druggists of New York City.

It had been expected that considerable opposition to the enforcement of this ordinance, which was adopted by the local Health Board to assist the local health commissioner in his campaign against "nostrums," would be manifested by the wholesale and retail drug trades of New York City, as well as by the national organization representing the proprietors and manufacturers of "patent" or proprietary medicinal preparations. The latter organization, in fact, has already made plans for fighting this ordinance in the courts and for attempting to have it adjudicated unconstitutional. Although some of the local drug jobbers, as well as retail druggists, have been summoned to appear as defendants in prosecutions begun by the local Health Department for their distribution of proprietary remedies, which the department has declared to be misbranded within the meaning of Subdivision "c" of Section 116 of the local Health Board's sanitary code, none of these jobbers now appears desirous of opposing openly the enforcement of the board's formula disclosure ordinance and, as the retail druggists' representative organization, the New York Pharmaceutical Conference, has recently asked the local health com-

missioner to keep the local druggists informed on what proprietary remedies he considers to be misbranded, in order that they may avoid handling them, it is evident that the burden of contesting the constitutionality of the ordinance now rests entirely upon the Proprietary Association of America.

The letter, in which several wholesale drug houses have signified their intention of complying with the local Health Board's proprietary medicine formula disclosure and registration ordinance, follows:

NEW YORK, Oct. 18, 1915.

DR. S. S. GOLDWATER, *Commissioner of Health.*

Dear Dr. Goldwater—The undersigned wholesale druggists and dealers in proprietary medicines have signified their intention of complying with section 117 of the ordinances of the Board of Health of New York city in regard to the selling only of registered patent and proprietary articles.

We also desire to go on record as favoring a Federal law regulating the sale of patent and proprietary articles, for the same reasons which brought about the passing of the above mentioned local ordinance. We are,

Very respectfully yours,

(Signed) BAKST BROTHERS,  
BRITT, LOEFFLER & WEIL,  
BRUN, RITCHIEY & CO.,  
EIMER & AMEND,  
HENRY KLEIN & CO.,  
LEHN & FINK,  
C. S. LITTELL & CO.,  
MAY & COHEN,  
MCKESSON & ROBBINS,  
SCHIEFFELIN & CO.,  
TOBBINS & JAMES.

Supplementing their action in thus notifying the local health department of their intention to observe the formula disclosure and registration ordinance, these wholesale druggists have also drafted and are now sending to manufacturers of proprietary medicines the following circular letter:

The undersigned wholesale druggists and dealers in proprietary medicines are confronted by the necessity of having their stocks of these goods in condition to comply with the terms of section 117 of the ordinances of the Board of Health of New York city, taking effect December 31.

It is our purpose to comply with the or-

dinance, and we ask all manufacturers to make their articles legally salable, as we decline to place ourselves in a position inviting prosecution.

We call your attention to the fact that the regulations do not require the disclosure of the complete formula and percentage composition, but merely a statement of active ingredients. As Federal legislation of a similar nature seems to be impending, compliance with these new requirements seems to be more urgent in order to make your products salable in all parts of the country.

Section 117 of the local Health Board's Sanitary Code, which was originally enacted at the close of last year, and which is to become effective at the end of this year, follows:

Sec. 117. Regulating the sale of proprietary and patent medicines.—No proprietary or patent medicine manufactured, prepared, or intended for internal use, shall be held, offered for sale, sold, or given away in the city of New York until the following requirements shall in each instance have been met.

The names of the ingredients of every such medicine shall be registered in the Department of Health in such manner as the regulations of the Board of Health may prescribe.

The expression "proprietary or patent medicine," for the purposes of this section, shall be taken to mean and include every medicine or medicinal compound manufactured, prepared or intended for internal human use, the name, composition or definition of which is not to be found in the United States Pharmacopoeia or National Formulary, or which does not bear the name of each ingredient conspicuously, clearly and legibly set forth in English on the outside of each bottle, box or package in which the said medicine or medicinal compound is held, offered for sale, sold or given away.

The provisions of this section shall not, however, apply to any medicine or medicinal compound, prepared or compounded upon the written prescription of a duly licensed physician, provided that such prescription be written or issued for a specific person and not for general use, and that such medicine or medicinal compound be sold or given away to or for the use of the person for whom it shall have been prescribed and prepared or compounded; and provided also that the said

prescription shall have been filed at the establishment or place where such medicine or medicinal compound is sold or given away, in chronological order, according to the date of the receipt of such prescription at such establishment or place.

Every such prescription shall remain so filed for a period of five years.

The names of the ingredients of proprietary and patent medicines, registered in accordance with the terms of this section, and all information relating thereto or connected therewith, shall be regarded as confidential, and shall not be open to inspection by the public or any person other than the official custodian of such records in the Department of Health, such persons as may be authorized by law to inspect such records, and those duly authorized to prosecute or enforce the Federal statutes, the laws of the State of New York, both criminal and civil, and the ordinances of the city of New York, but only for the purpose of such prosecution or enforcement.

Regulations supplementing this ordinance were promulgated June 30 of this year. They modify the ordinance's general requirement that the names of the ingredients of every medicine shall be registered in the Department of Health by stating that no disclosure of the quantities of these ingredients is called for, and that only the names of the active ingredients on which therapeutic claims are based, not those of inert substances, such as flavoring or coloring agents, are to be set forth in the application for the registration of the proprietary medicines in question. These regulations however, demand a registration certificate for every patent or proprietary remedy held, offered for sale or sold or given away in New York City—and seek to compel the labeling of each package containing these goods with local registration phrase and registration certificate number.

The Proprietary Association of America has advised all its members, including the leading proprietary medicine manufacturers of this country, to ignore the provisions of this local formula disclosure ordinance and its regulations, on the ground that they are wholly unconstitutional, because they seek to deprive them of their vested property rights by attempting to compel disclosure of privately owned formulas, even though such disclosure is only partial. In particular, this as-

sociation is determined to have the ordinance declared unconstitutional on the ground that it prohibits the "holding" of non-complying proprietary preparations by local wholesalers or retailers, as it contends that a merchant has a legal right to "hold" any article of commerce which he desires, regardless of whether it meets with the sale requirements of local statutes, provided that such article is not sold within the jurisdiction of such ordinances or laws.—From Oil, Paint and Drug Reporter.

#### PRESCRIPTIONS AS PUBLIC RECORDS.

The right of a state to constitute druggists' files of prescriptions public records in the sense that a druggist may be compelled to produce them before a court or grand jury as an aid in the enforcement of regulations governing the sale of intoxicating liquors, was upheld by the Missouri Supreme Court in the case of *State vs. Davis* (18 *Southwestern Reporter*, 894).

Defendant was indicted for violating a statute requiring every druggist to "preserve all prescriptions compounded by him or those in his employ, numbering, dating and filing them in the order in which they are compounded," and to "produce the same in court or before any grand jury, whenever thereto lawfully required." Defendant attacked the validity of this provision on the ground that it sought to compel one to surrender private papers which might tend to incriminate him, in violation of the guaranty of the federal constitution that no person shall be required to furnish evidence against himself in a criminal case.

But the court refused to regard prescriptions as necessarily belonging to the class of private papers. Speaking of the public policy of permitting druggists to sell intoxicating liquors, the court said: "It was, therefore, deemed necessary that druggists in compounding medicines and filling prescriptions should have the right to sell liquor as a medicine. There can be no doubt that the legislature had the right to impose its own conditions in authorizing such sales. It undertook to do so by the provisions of Section 4621, which limits sales to those made under the written prescription of a regularly registered and practicing physician. \* \* \* These prescriptions thus became the license, or jus-

tification, to the druggist for making sales, which otherwise would be unlawful. As evidence of authority to make particular sales they would constitute private papers of the druggist, but could not be regarded as evidence of crime, but rather of innocence. The chief purpose of their preservation, however, was evidently that they might be used in giving aid to courts and grand juries in their proper and lawful endeavors to control and regulate the sale of intoxicating liquors within the limits prescribed by the legislature, and, in the investigation of matters of public concern. In these respects all the prescriptions become public and not private papers, and the druggist merely their custodian.—Through Druggists' Circular.

#### HARRISON LAW ORDER FORM RULING.

In a decision issued by the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasurer (T. D. No. 2244), there are set forth the requirements regarding the preparation and signing of narcotic order forms, as follows:

In entering items calling for narcotic preparations and remedies on the order form issued in accordance with the provisions of section 2 of the act of December 17, 1914, the quantity of narcotic drug to the ounce must be indicated, or if ordered in tablet form, the total number of tablets and the quantity in grains per tablet should be stated.

The signing of narcotic order forms with a firm name with no other name to indicate who wrote the order, will not be permitted. The name of the principal officer of a firm, corporation, partnership or company, or the person who is granted through power of attorney authority to sign such orders, must invariably appear thereon, and druggists and dealers are cautioned against filling such orders unless these requirements are complied with. Stamp or printed signatures on order forms are not permitted, and in every instance there must be an indication of individual responsibility in the preparing and signing of these forms.

#### A RECENT DECISION AFFECTING THE HARRISON LAW

A demurrer to an indictment against a physician for not registering prescriptions of habit-forming drugs was sustained by Judge Dyer in the Federal District Court at St.

Louis, October 28, on the ground that the Harrison law provided no penalty in case physicians did not register such prescriptions.

#### SERIOUS DEFECT FOUND IN HARRISON LAW.

According to a decision which has just been rendered by Judge Wilbur F. Booth, in the United States District Court in Minneapolis, Minn., "mere possession of opium and cocaine or their derivatives by a person other than an importer, a manufacturer, seller or compounder, does not make him liable under the provisions of the Harrison law."

This judicial finding appears to point out a serious defect in the Federal narcotic sales regulation enactment.

Judge Booth made the decision when sustaining a demurrer to an indictment against Charles E. Jeannin, who is neither a recognized handler nor dispenser of the narcotics in question, charging him with having some of these drugs in his possession. The case against Jeannin was thereupon dismissed on motion of the defense. Judge Booth's opinion stated: "The Harrison law defines certain persons who can offend under its provisions. They are those who produce, import, manufacture, compound, sell, dispense, or give away opium, coca leaves, their salts or derivatives or preparations. These persons may offend in four ways—by producing, selling, transporting or having in their possession drugs without meeting the requirements of registration. But mere possession does not constitute a violation of the act in the case of persons who are not among those classes named."

In this decision, Judge Booth has followed a precedent of the United States District Court of Montana, but Judge Booth's decision defines the scope and applicability of the law much more clearly than the Montana decision.

Federal officers who have hitherto trusted implicitly in the efficacy of the Harrison law's provisions to apprehend habitués of the narcotics in question, are greatly disgruntled at Judge Booth's decision, which United States District Attorney Alfred Jacques, in Minneapolis, contends will "give immunity, as far as the Federal government is concerned, to those 'dope fiends' who are caught with drugs in their possession."

"It means, moreover," says Mr. Jacques,

"that internal revenue officers, who suspect certain individuals, cannot arrest them and convict them merely because they are caught carrying the drugs. The government in the cases of these persons will have to prove that they have actually sold or given away the drugs to others."—Oil, Paint and Drug Reporter.

#### DETERMINATION OF FREE SULPHUROUS ACID BY TITRATION.

A comparison of the methods previously employed shows that there is a discrepancy in the results obtained. Against standard sodium hydroxide, using phenolphthalein as indicator (which carries the operation to the formation of neutral sulphite), the results are higher than those obtained by titration with iodine solution. Using methyl orange as indicator, the end point of which is the formation of sodium bisulphite, the results are practically equivalent to those obtained with iodine. The discrepancy is due to the fact that methyl orange only reacts sharply to mineral acids, and is not accurate in the case of weak acids, such as sulphurous. A new method is, therefore, suggested. The sulphurous acid is oxidized to sulphuric acid

by means of hydrogen peroxide, which is then determined by titration with standard alkali. The oxidation takes place completely in two minutes. The results obtained are consistent, and are just double the figures obtained by direct titration with standard sodium hydroxide, using methyl orange as indicator. A second method is also suggested. This consists in treating the sulphurous acid solution with mercuric chloride after first half neutralising it with sodium hydroxide. The following reaction takes place:

The free hydrochloric acid is then titrated in the ordinary way; the presence of the double salt does not interfere with the reaction of the titrating reagent. No oxidation takes place during the progress of the reaction, as evidenced by its behavior to barium chloride solution. The results obtained by this method compare favorably with those obtained by direct titration with sodium hydroxide, using methyl orange as indicator. Thus, for instance, ten mls of sulphurous acid solution required 4.3 mls of N/10 sodium hydroxide by direct titration with methyl orange, and after treatment with mercuric chloride solution 8.6 mls were required.—A. Sander (*Chem. zeit.*, 106-107, 1,057.)

#### REMOVING MARKING INK STAINS

In ordinary cases, that is, where the composition of the ink is unknown, the following steps should be taken, in order:—(1) First soak in a solution of common salt, and then wash with ammonia. (2) Treat with a solution of potassium cyanide, 10 grains; iodine, 5 grains; in water, 1 fl. oz. (3) Moisten with a solution of iodine in potassium iodide, and then wash with water. (4) Treat with strong solution of zinc sulphate, and then touch with a piece of metallic zinc, or sprinkle with powdered zinc, afterwards washing. (5) Treat with solution of chlorinated lime, freshly prepared, and then with a solution of acetic or citric acid in water. (6) If the stain should happen to be one made by alizarin ink, it may be removed by treating with a solution of tartaric acid; the older the stain the more concentrated should be the solution.—*The Pharmaceutical Journal*, 1915.

## Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or *type-written*.

### CHANGES OF ADDRESS SINCE SEPT. 18, 1915.

SCHUEFER, R. F.

From 909 Park Ave., St. Louis, Mo.

To 511 Metropolitan Bldg., St. Louis, Mo.

CONNELL, ROY L.

From Livingston, Mont.

To residence unknown.

POLOSKY, EVEL

From 164 Broadway, Buffalo, N. Y.

To residence unknown.

FLAKE, W. L.

From Box 64, Water Valley, Miss.

To residence unknown.

### LIST OF A PH. A. RESIDENCE UN- KNOWN

Members will confer a favor by supplying the present address of any of the following to Treasurer H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Barnes, Arthur H., 11 Newberry St., Boston, Mas.; Bernhardt, Magnus, Sergt. H. C. U. S. A., Manila, P. I.; Black, Perry N., 5165 Penn Ave., Pittsburg, Pa.; Billups, Chas. A., Jefferson Barracks, Mo.; Bost, W. D., 340 Eddy St., San Francisco, Cal.

Chapman, Thos. A., 353½ Yam Hill St., Portland, Ore.; Connell, Roy L., Livingston, Mont.; Cooney, Jos. H., 499 Columbus Ave., Boston, Mass.; Cowan, Ernest L., 82 Congress St., Rumford, Me.

Davenport, Jesse S., Ft. Bayard, N. Mex.; Delgado, Jos. V., Colon, Panama, C. A.; Dietz, Henry W., Ft. Wm. McKinley, Rizal, P. I.; Dodson, Carl M., 418 So. Washington, Enid, Okla.; Downs, Fred C., Craig, Colo.

Echols, Geo. J., 308 W. Main St., Richmond, Va.; Elliott, Geo. J., 56 10th St., Detroit, Mich.; Eyes, Robt. L., 401 Broad St., Nashville, Tenn.

## STATEMENT OF OWNERSHIP, MANAGEMENT, ETC.,

Of the Journal of the American Pharmaceutical Association, published at Columbus, O.

Editor—E. G. Eberle, Columbus, Ohio.

Managing Editor—E. G. Eberle, Columbus, Ohio.

Business Manager—E. G. Eberle, Columbus, Ohio.

Publisher—American Pharmaceutical Association, Office at Columbus, Ohio.

Owners—The American Pharmaceutical Association, Office, Columbus, Ohio.

Is a corporation not for profit, incorporated under U. S. Laws at Washington, D. C., and does not have a capital stock.

## ASSOCIATION OFFICERS, 1915-1916.

President—Wm. C. Alpers, Cleveland College Pharmacy, Cleveland, Ohio.

Honorary President—F. C. Godbold, 5601 Rosemary Place, New Orleans, La.

First Vice President—Chas. H. LaWall, 39 South 10th St., Philadelphia, Pa.

Second Vice President—E. A. Ruddiman, 1916 Adilicia St., Nashville, Tenn.

Third Vice President—Linwood A. Brown, 425 Transylvania Park, Lexington, Ky.

General Secretary—Wm. B. Day, 74 East 12th St., Chicago, Ill.

Treasurer—H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Known bondholders, mortgagees, and other security holders, holding 1 per cent or more of total amount of bonds, mortgages, or other securities, none.

(Signed) E. G. EBERLE, Editor.

Sworn to and subscribed before me this eleventh day of October, 1915.

(Signed) J. C. PLATAS,

Notary Public in and for Dallas County, Texas.

My commission expires June 1, 1917.

## KAMBARA EARTH AND ITS USE AS A REAGENT FOR COD-LIVER OIL.

Kambara earth is called "acid earth" or "acid clay" in Japan, and is widely used in

oil factories as the bleaching and refining agent of mineral and fatty oils. It is now stated that it has "a remarkable bleaching action on fatty oils." The earth has recently been studied (see *P. J.*, February 16, 1913, 213), but no reports on the bleaching action of the earth on fatty oils appear hitherto to have been published. The earth occurs in three color varieties—bluish-green, brownish orange, and light yellow. As a result of experiments with these varieties in the bleaching of fatty oils, it is shown that the color of the spent residual earth (i. e., the earth which has been used to bleach the oils) is related to the degree of oil-bleaching of the originally used earth, and the more deeply colored earth serves as a bleaching agent more effectively than the lighter-colored earth; the brownish bleached better than the greenish, so that one can easily foretell the bleaching properties of an unknown earth, and also distinguish the end point of the bleaching action. The bleaching action of the earth increases with the rise of temperature to a maximum at about 140° C., and then gradually decreases. The optimum temperature varies according to the kind of oils and fats; drying oils, fish oils, etc., were bleached generally at lower temperatures than soya bean oil. Well-bleached oils are nearly colorless; in other respects, the characters are not essentially different from those of the original oils. On account of their harmless effect on nickel catalyser they can be recommended for use as the raw materials in oil-hardening plants. Among the observations made by the author is, the following:—"A color reaction on cod-liver oil.—A few grammes of the earth were mixed with cod-liver oil in a test tube and then shaken; the earth became a beautiful bluish-green color. The coloration seems due to the presence of coloring principles in the oil, and is a very characteristic one. According to my experiments, most other oils have not such a coloration, so that this coloration would seem applicable to the detection of cod-liver oil."—Seüchi Ueno (*Journ. Ind. and Eng. Chem.*, July, 1915, 596.)

## AIM OF SCHOOLING.

"The aim of all schooling should be practical; that is to say, intended for some use in the scheme of modern society. Service is primarily the distinguishing basis of education—service to our fellow-man, service to the state and service so that justice may come to be a reality in man's relation to man.

"The college is accomplishing a wonderful work in building the foundations for business life, in providing the trained hand and mind to assist in constructing an honest pattern of commerce out of the warp and woof of new material; in providing the professions with new helpers and in teaching the gospel that the idler has no place in the busy haunts of men. I am a conservative and would not have the feverish industrialism of this day uproot the finer branches or deny to the classics their place in the curriculum of the college. The beauty of culture is necessary to our ideals.

"By scholar I do not mean the pale ascetic—a glow-worm who illumines with faint light some dark passage through which men seldom wind their way, or one who explores some dark attic of out-of-way knowledge and stirs the drowsy bats to startled flight; but the boy or girl, the man or woman, who is a blend of the ideal and practical, who has the saving grace of common sense, clarified by knowledge, strengthened and vitalized by learning and education. The true scholar is a doer of things, one who lives for achievement. Today it is the scholar who is seeking by experiment and patient vigil to combat the dread diseases that scourge the human family, who gives up his life, a soldier of civilization without seeking the blood of his fellow-man. It was a scholar who mapped and charted the currents about the pole; a scholar who devised the means by which our messages could be carried through the air on waves of ether from far distant points on land and sea, and it is the scholar who is teaching our unwilling farmers how to utilize every chemical element of earth and sky to grow the bread-stuffs in our state that will feed the peoples of the world. When this comes about then will cotton cease to be the undisputed monarch of our fields and share its scepter and dominion with the yellow corn and the ripening grain.

"Let it be taught in every school that no government can be better or higher than the average character of its people. Let it be taught above all things that class hatred is an abomination; that there is no class in our government, but an aristocracy of intellect, a titled nobility of mind and heart; and let it be impressed that all respectable elements of society are co-ordinated in one beneficent system—the public welfare of all. Strangle the demagogue who preaches resort to the bullet or the incendiary's torch, who ridicules education and compliments ignorance, who inflames without enlightening. In the effort to correct evils—and materialism is the predominant evil of this generation—let it be known that honest wealth itself is not a crime. When wealth endows our schools and maintains our hospitals and builds our churches, when it spreads light in the dark corners of the earth, it is a benediction and not a curse."

FREDERICK J. WULLING

President-Elect, American Pharmaceutical Association

The Association does not accept the responsibility for the opinions of contributors. Offensive personalities must be avoided.

IAN MACLAREN tells somewhere a sweet story of his native land, that while walking leisurely along a country road during midday of a very warm day, he met a bonnie wee lass, all humped up and red, and puffing with the weight of a chubby laddie she was carrying.

"Isn't he too heavy for you?" asked the dominie.

"He's not hivvy, sir," came the answer, with a smile of loving pride, "he's ma brither!"

How well we may apply this beautiful lesson to our lives, to our Association, but we desire to utilize it for the text of our

## CHRISTMAS WISH FOR YOU.

Before the next number of the Journal comes to you, another Christmas will have come and gone. It constitutes an event in the lives of all people in civilized countries, be they young or old, that is looked forward to with joy, though mingled with much sadness and sorrow in turbulent Europe, nor is there entire absence in this peaceful country of ours. When sadness and sorrow may be displaced by a kind act, both the recipient and contributor share in the intensity of the joy. No doubt, each one of our members will spread some happiness in this way, for what is Christmas unless it brings such opportunities? We hope that all will participate in such joyous occasions of well-doing, for surely nothing contributes greater pleasure, and also revives the knowledge of the brotherhood of man. Therefore, we can think of no better wish for our readers, accompanied by the expressed hope, that all may enjoy this happy season uncontaminated by sadness or misfortune of any kind.

## THE NEW YEAR.

The New Year, while carrying the legacies of the old world, is ours to mold. We cannot afford to begin wrong, and a proper observance of the days that are upon us psychologically for the trials and tribulations, successes and failures of the next cycle of time—the calendar year.

We may be assured that while as pharmacists we have shared great responsibilities, larger service is expected of us in the coming years, because of greater opportunities which we cannot afford to neglect. Let us pause for awhile, take stock, get our bearings and meet the responsibilities and accept of the opportunities with a well calculated gait and in an optimistic spirit.

## Section on Education and Legislation

Papers Presented at the Sixty-Third Annual Convention

### MINUTES OF THE SECOND SEPARATE SESSION OF THE SECTION ON EDUCATION AND LEGISLATION.\*

The second session of the Section on Education and Legislation was called to order by Chairman Freericks in the Red Room, Bellevue Hotel, San Francisco, on Thursday, August 12, 1915, at 2:15 p. m.

Professor E. L. Newcomb acted as Secretary pro tem.

Chairman Freericks: The report of the Committee on National Legislation and also the report of the National Drug Trade Conference seem to have gone to the General Session. The next order of business will be the consideration of the report of the Committee on Regulations for Transportation of Drugs by Mail of which Mr. B. L. Murray is the Chairman.

#### REPORT OF THE SPECIAL COMMITTEE ON REGULATIONS FOR TRANSPORTATION OF DRUGS BY MAIL.

At the annual meeting held in Detroit in August of last year, 1914, the Committee on Post Office Regulations for the Mailing of Poisons made a full report on the situation, taking up the causes of the unfortunate position in which we find ourselves and setting forth at length the laws and regulations governing or rather preventing the mailing of poisons. (See *Journal American Pharmaceutical Association*, February, 1915.) The Committee's report was heard and accepted, and the Committee itself discharged. It was evident, however, that work of this kind, to be of value, must be continuing and some weeks after the August meeting the Committee, slightly rearranged, was reappointed. It is now known as the Special Committee on Regulations for Transportation of Drugs by Mail.

The situation as depicted in our last previous report remains unchanged today, no new laws having been passed and no new regulations having been promulgated. It is still illegal to send poisons through the mails, even though they can be packaged in such way as to make them safe for all that handle them. It is a daily occurrence that small parcels containing poisons must be handled by express, and usually at greater expense, merely because we forbid ourselves the use of our parcel post. The express companies handle the packages with entire safety both as to their employees and as to the goods. In the meantime our Post Office Department in Washington instead of being allowed to increase its usefulness, is issuing statements showing millions of expense beyond its receipts.

It has been suggested by some that each individual take the subject up with his postmaster, urging an extension of the parcel post so that poisons may be handled through the mails. It might stimulate the Post Office Department to a closer consideration of the subject if it were brought to the attention of the Department constantly by the postmasters themselves. If it were taken up on the basis of an extension of the parcel post as well as a needed added facility in the drug business it would perhaps be of value.

\*Papers read before the Sections will be accompanied by the discussions and are therefore omitted from the minutes.

Your Chairman, who is writing this report because he feels it is only a report of progress, expresses the view of the Committee as shown by correspondence that two fields are open to us, and both must be cultivated. First, we must continue to voice our disapproval of present conditions, as we do from time to time, and second, exert our influence to secure the passage of a national poison law especially drawn to regulate interstate commerce in poisons. Handling poisons in the mails will naturally follow the enactment of such a law.

The Committee has made a study of the above two fields of operation during the year and has noted with interest the attention that other bodies also are giving to the subject. It is therefore suggested that the work of the Committee be carried on through the coming year or years, recognizing at once that the work is likely to be lengthy. The Chairman would be glad to suggest one or two more names to add to the membership of the Committee.

Respectfully submitted,

B. L. MURRAY, Chairman.

Chairman Freericks: You have heard the report of the Committee, what is your pleasure?

It was moved by W. C. Anderson, and seconded by Dr. Otto F. Claus, that the report be received and that it take the usual course.

Chairman Freericks: Are there any remarks? The Chairman of the Committee suggests one or two other names for increasing the membership of the Committee. Do you desire to take that into consideration at this time or shall we simply receive the report and let it take its usual course?

Dr. W. C. Anderson: I wish to ask how the number of members of that Committee is provided for?

Chairman Freericks: The Committee was appointed originally by this Section two years ago. It is a Committee of this Section, and as I understand it, the number of the Committee may be increased.

The motion having been regularly made and duly seconded, it was declared carried, after voting thereon.

Chairman Freericks: Now, is there any desire to act upon this recommendation?

Dr. W. C. Anderson: I move that the request of the Chairman of this Committee be complied with and that the Committee be increased by the addition of two extra members.

(Seconded by Dr. Otto F. Claus.)

Mr. R. F. Troxler: I would like to amend Dr. Anderson's motion and offer a substitute.

The Chairman intimates that he would like to suggest the names of the two additional members. I move that he be invited to suggest them and that he appoint them on the Committee. Is that agreeable?

Dr. W. C. Anderson: I will accept that.

Chairman Freericks: The amendment, as proposed by Dr. Troxler, is accepted by the mover of the original motion and his second.

The motion carried.

Chairman Freericks: The next order of business is the report of the Committee on Survey of the Pharmaceutical Teaching Institutions, by Mr. Hugh Craig, Chairman.

The Chair would accept the opportunity of saying that this is a most impor-

tant work. The report is the first one made by the Committee, and since the task undertaken is an enormous one, you must look to the fact that it is only the beginning of the work, but I believe you will find it of great interest. Miss Cooper has kindly consented to read this report.

#### REPORT OF COMMITTEE ON THE SURVEY OF TEACHING INSTITUTIONS.

Your Committee's report will be one of progress and suggestion. The progress has not been very marked because the Committee was not appointed until early in the year 1915 (through no fault of the honorable Chairman of the Section); and because none but very busy members could be secured to act on this Committee—a common condition—and also because the Committee was quite without instruction as to the scope of its purpose.

Your Committee has hesitated to essay the work which, doubtless, was intended for it, that is, a classification of the pharmaceutical teaching institutions of the country, because it had no basis for such a classification and did not feel empowered to define a basis and operate thereupon without first submitting the scheme of classification to the creating body for approval. Your Committee, therefore, takes this occasion to *recommend that this Section prepare a classification of the teaching institutions giving personal instruction in pharmacology, and for pharmaceutical ends, in the allied subjects embraced within the examinations by boards of registration in pharmacy, on the following bases:*

- a—Degrees conferred.
- b—Actual entrance requirements.
- c—Length of courses.
- d—Scope of courses.
- e—Obligations as to attendance.
- f—Passing grades.
- g—Number and qualifications of members of faculty.
- h—Value of property, real and chattel, owned by institution.
- i—Affiliation with a university or other educational group.
- j—Ratio of fees to operating expenses.

Your Committee feels that this Section may well interest itself in the several matters embraced in the foregoing list of bases for classification and that it can do a great deal to bring about uniformity, at least in, say, three, general classes, of teaching institutions, and assist materially in eradicating the evils which are commonly complained of in connection with the practices of teaching institutions in these regards.

With regard to bases a, b, c, and d, your Committee feels that the path blazed by the American Conference of Pharmaceutical Faculties should be followed, but that some further endeavor should be made to assure a proper rating of qualifications in preliminary education, other than that obtained in a high-school, in other words, of the so-called "equivalent." This "equivalent" should be based upon subjects which are of practical value to the future chemist, and the required counts or units should cover not less than five subjects, three of which should be: English, mathematics and physics.

Your Committee recognizes the delicacy of any attempt to standardize teaching faculties, but it believes such a step to be an important one and a necessary one. In the first place, those who set themselves up as teachers should know, not only what they are teaching, but as well how to impart knowledge. It would be well if they were required to have some training in pedagogic practice. On the other hand, the efforts of a teacher, without actual practical experience in the operation of a drug store, to instruct students in the commercial phases of pharmaceutical practice are quite likely to prove as disastrous in the future life of the student as have been many of the purely theoretical ideas of the so-called "efficiency experts." Very little of the very necessary psychology of selling can

be learned from books, the salaries of advertising experts notwithstanding. Of course, a retail druggist, with the druggist's usual lack of familiarity with accounting, is an equally poor teacher. And commercial training is the one most needed qualification in the retail drug business today, because the commercially trained young man will recognize the folly of setting up in business with more mortgage than capital in his investment, and much debauching of pharmacy and unfair competition will be obviated.

A question that calls for careful consideration in the standardizing of teaching faculties is the effect of recruiting the faculty from among students of the institution. Few, if any, teachers can impart their full knowledge of a subject to a student; and to hand down from teacher to student the task of instruction in any one subject is to court the detrimental effects of what may be styled inbreeding.

Another fault, somewhat of a similar relation, is that of manufacturing a faculty by conferring higher degrees upon complacent, yes, eager, prospective or acting teachers. This practice is widely at odds with educational ethics and should be frowned upon by this Association.

So much for comment upon the Committee's suggestions for a scheme of classification. It is, of course, not the idea of the Committee that the rankings on the several bases, suggested above, are to be cumulated to indicate the school of the highest grade. Some of the bases are closely related and may be cumulated quite properly; but others are more informative than essential in this regard.

It is the belief of your Committee that this Section should take cognizance of other phases of pharmacal education than that of the school giving personal instruction. There are a number of correspondence schools in pharmacy, some of which, to the personal knowledge of members of the Committee, are so lax in their methods of gauging the progress of their students as to give very high rankings to students who have answered the questions apparently with an open book before them, because, separated from the informative volume, they are totally at a loss for an answer to the simplest questions. It is quite properly the duty of this Section to make it possible for prospective students to get the correct appreciation of the value of a correspondence course. If this Association fails to point out clearly the difference between knowledge and instruction, it does not serve the purpose for which it stands in the general pharmacal opinion.

In several cities the Young Men's Christian Association conducts classes in pharmacy, and the practice is spreading. The instruction given in these classes compares favorably with that given in the minor schools of pharmacy. As long as there is no general adoption of graduation from a standardized school of pharmacy as a prerequisite for examination by a board of pharmacy, this Section should pay as much attention to the supply of properly qualified pharmacists, from whatsoever source, as to the supply of teaching institutions of a certain standard; it should interest itself in every means of educating the pharmacal novice. That interest on the part of this Section in the Y. M. C. A. work will be welcomed is indicated by the following quotation from a letter received by the Chairman of your Committee from Mr. George B. Hodge, the Secretary for the educational department of the International Committee of Young Men's Christian Associations:

"We shall be glad for your helpful suggestion with reference to any step we may take or ought to take, that such courses may be strengthened, improved, and in keeping with the standards of your general association."

Of particular interest to those who have any concern for the education of the pharmacist has been the action of the educational authorities in several cities, Cincinnati and Chicago being prominent examples, in coöperating with local pharmacal organizations to provide part-time instruction in the high-schools for apprentices in drug stores, the purpose being the commendable one of affording an opportunity for the apprentice to acquire the preliminary educational qualifications required by the better colleges of pharmacy, and very necessary for the

welfare of pharmacy. By a proper correlation of the apprentice's work and study in the store—it is to be hoped that the old apprentice system has not been so far neglected as to make the boy's service all work and no study, and with the instruction given in the high-school, this plan will do more than anything else to provide educated and able pharmacists. It should, therefore, have the heartiest approval of this Section, and the members of this Association should urge its adoption in every community and lend every assistance in the laying-out of a scheme of instruction, properly correlating the instruction given in the school and that given by the preceptor. *Your Committee recommends that this Section take steps toward the adoption of a scheme or curriculum for correlated instruction of this sort.*

The growing importance of the trained sanitation officer to every community is sufficient reason for this Section to interest itself in the education of persons to fill these offices. Something more than a chemist and bacteriologist is needed, and *your Committee would recommend that this Section urge pharmacal schools, which are so affiliated or located as to be able to do so, and the Young Men's Christian Association to establish a course in connection with a technical school or class, which will qualify students as sanitation officers and to confer upon them a certificate or diploma of public health.*

The field, in which your Committee has done such a little preliminary scratching of the top soil, is one well worthy of the most careful attention of this Section of the general Association. Your Committee, therefore, recommends *that the work begun by it be carried forward*, and requests a careful and thorough consideration of its suggestions, so that those, into whose hands may be entrusted the real work of surveying and improving this important field, may be able to go about the performance of their task in a thoroughgoing manner. There are many contingencies to be met, many disasters to be avoided, and many pitfalls to be escaped in the proper performance of this task; but the results are so important to the future of pharmacy that the work should be put forward with diligence and dispatch.

Appended is a list of one hundred and fourteen institutions of various sorts, which are engaged in offering some variety of instruction in pharmacy. This list is not offered as being complete, because it is not possible to get information about every tutor-shop and plugging school. Much assistance was given to your Committee in the compilation of this list by Prof. J. A. Koch, the Chairman of the Executive Committee of the American Conference of Pharmaceutical Faculties, and by the secretaries of a number of the state boards of pharmacy, and to these we desire to express our appreciation and gratitude. For obvious reasons we have omitted from this list the schools in Canada, Cuba, Porto Rico, and the Philippines, believing the field afforded by the continental portion of the United States, sufficiently extensive for the original purpose of the work of survey.

Respectfully submitted,

J. H. BEAL,

H. C. CHRISTENSEN,

HUGH CRAIG, Chairman.

Chairman Freericks: You have heard this most interesting report of the Committee, and I would like to ask now what is your pleasure with reference to it?

Dr. W. C. Anderson: I move, Mr. Chairman, that the report be received and referred to the Committee on Publication, with the recommendation of the Section that the Committee be continued or that this work be continued, at least, and the report of the Committee be approved. Seconded by Mr. Binz.

A Member: I notice that the report refers to giving degrees. I do not know just exactly how it was expressed, anyway, that we were not competent to fill the position that the degree placed the student in. While it is true, I think, that several of our members did not have the opportunity to go to college years and years ago, yet they have done good work for the Association, and for pharmacy. It is very nice to honor them by a degree, even though their teaching may not be high enough to warrant it. I believe it is a deserved honor, and I believe in honoring people while they are alive and not waiting until they are dead.

The motion of Dr. Anderson was called for, and carried by vote.

Chairman Freericks: We will now have the report of the Committee on Patents and Trade-marks. This report will be read by Mr. England.

Before the reading of the report, Mr. England stated that the Chairman of the Committee is Dr. F. E. Stewart, who, unfortunately, is not able to be present, and had asked him to read the report.

#### REPORT OF THE COMMITTEE ON PATENTS AND TRADE-MARKS.

Owing to the shortage in supplies of imported chemicals, caused by war conditions in Europe, and the hinderance to plans for manufacturing them in the United States because of patent grants made to foreign inventors, who are not

manufacturing them in this country, the question of patents and trademarks has occupied considerable prominence during the past year.

The Chairman of your Committee, as your representative and as a representative of similar committees of the Pennsylvania State Pharmaceutical Association, and of the Philadelphia Merchants' and Manufacturers' Association, attended the hearing at Washington before the House Committee on Patents in relation to the Paige Bill, in company with Mr. Samuel C. Henry, President of the National Association of Retail Druggists, and Mr. Jacob H. Rehfuess, Chairman of the Legislative Committee of said association. The Paige Bill and the hearing<sup>1</sup> referred to are of so much importance to pharmacy that your Committee is presenting both documents as part of its report.

You will note that your Chairman filed a brief with the House Committee on Patents, which appears in the official report of the hearing. This brief consists of Preambles and Resolutions constituting his report as Chairman of the Committee on Patent Law Revision of the Merchants' and Manufacturers' Association, and includes a proposed revision of certain sections of the copyright, patent and trademark laws, which bear upon the chemical industries and the materia medica supply business.

The proposed revision was undertaken by your Chairman in response to the request of Dr. S. Solis-Cohen, Chairman of the Committee on Scope of the Committee having charge of the revision of the United States Pharmacopœia.

The salient features of the proposed revision consist in certain additions to and modifications of the laws, as follows:

1—Modification of the patent law to prevent aliens from obtaining patents for their invention in the United States except in case they manufacture them in this country, within a stated period of years dating from the issue of United States patents.

2—Adoption of a provision in the U. S. Patent Law, similar to a provision contained in the German Patent Law, and also contained in the Patent Laws of most foreign countries, which limits patents related to new chemical and food products to processes and apparatus for manufacture, and requiring inventors of alleged improvements to prove them to be such before placing the same on the market in competition with the inventions of original patentees.

3—Addition of a section to the copyright, patent and trademark laws, respectively, definitely stating the fact that names of new articles of commerce are neither copyrightable or patentable.

4—Addition of a section to the patent and trademark laws requiring applicants for patents or trademark registration, to give the name of the article for which patent is asked or trademark registration requested, said name to appear afterward as the principal title on all labels and advertisements of said article, when placed on the market.

The following exception to our position in relation to so-called trade names has been filed with your Committee:

"When a patent was granted by the United States to the inventor of acetphenetidin this gave an absolute monopoly to the manufacture and sale of said article for a limited time. When that time expired everybody secured the right to manufacture and sell said article, and a monopoly in the manufacture and sale ceased altogether. Now you would hold it to be wrong that the patentee for said article adopted the coined name phenacetin and made acetphenetidin generally known by such coined name, so that those who buy and use the article are accustomed to call for it as phenacetine. There was absolutely nothing which prevented the professions and the public from becoming accustomed to call for said article by the name acetphenetidin, and the original patentee or those holding his rights could in no manner complain, if the patented article was generally called for by such name and then upon expiration of the patent everybody being accustomed to call for it by such true descriptive name, the advantage of the original patentee would entirely cease with the expiration of the patent.

"Now because the professions and the public are indifferent to the use of a correct de-

<sup>1</sup>This is too lengthy for printing in the Journal. Those who desire a copy can secure one by addressing the Committee on Patents, House of Representatives. The date of the Bulletin is January 28, 1915.

scriptive name or because they are too lazy to use it you complain and condemn the patentee for having acquainted the public with a name coined by him, which results in securing to the original introducer the acetphenetidin manufactured by the original patentee. It is right at this point where our views differ. I am inclined to believe that you would object quite as much if the patentee had advertised his article as Jones' acetphenetidin, and had been able to have the public always call for Jones' acetphenetidin instead of simply acetphenetidin. Of course, you will agree that no one in justice could object if through extensive advertising the patentee had induced the public and the professions to invariably designate his article as 'Jones' acetphenetidin,' and thus secure advantages in the continued demand for the article after the expiration of the patent, but because he has decided upon a coined name to mean exactly the same thing as Jones' acetphenetidin, you believe that his conduct is much to be condemned.

"After all in this connection it is merely a question of degree. It is understood, that the public will far more readily take to a coined name, but fundamentally there is no difference, and if the patentee might succeed in having the name of the article invariably used in connection with *his own* name, then as stated the result would be the same and there ought not to be an objection on any ground."

No one disputes that the manufacturer of a new product, who places it on the market, and succeeds in creating a demand for it, by honest advertising, has a right to all of the business he can obtain in this manner, provided, of course, the product itself can safely be used by the public, without injury to health or morals. No one disputes that the use of a distinctive mark, word, or trade name to designate and distinguish his brand from all other brands of the same article, and the creating of a demand by advertising the article under a brand name, are both legitimate and may be advisable from a commercial standpoint.

It is, therefore, important that the trade name should be properly used, otherwise, in case of a lawsuit, the manufacturer may find himself without the protection of the courts. The method of using the trade name described by our objector, is not the proper manner, as the following facts will clearly show:

It is evident that the object in view on the part of those manufacturers of materia medica products who patent their alleged inventions under chemical names, and market them under coined names, is to obtain monopolistic control of the products so marked, after the patents expire, and thus defeat the object of the patent law, which is to grant inventors the right to prevent others copying their inventions for limited times, after which their manufacture is required to be open to competition on equal terms with the patentee.

The coined name, when used in this manner, becomes, by such use, descriptive of the article itself, and it is an axiom of law that a descriptive name cannot be a trademark. Used in this manner the name ceases to be a trademark, even though it may have been registered as such and becomes a synonym and as such can be used by any manufacturer in labeling the same product. This is well illustrated in the case of saccharin, the chemical name of which is benzoylsulphonic imide. By persistent advertising the word saccharin was forced into the language as a noun and became known to the public as an appellative. When the patent expired benzoylsulphonic imide became public property, together with the name saccharin. Now it is listed in Merck's Index as "Saccharin Merck," and under that name appears its chemical name benzoylsulphonic imide, and also all of the so-called trade names, such as "Garantose," "Glusidum," etc. It is manifest that when Merck & Co. received an order for benzoylsulphonic imide under any one of these so-called trade names, they would feel free to supply it under the name Saccharin Merck.

Is this action of Merck & Co. in harmony with the object of the patent law? Let us analyze the question.

Benzoylsulphonic imide is a definite chemical substance which, if properly made, corresponds to the same tests for identity and purity no matter which manufacturer produces it. It first appeared on the market as "Saccharin." The name "Saccharin" was claimed by the commercial introducer as a trademark or trade name. Its sale was inhibited by patent protection. These restrictions have been removed by the expiration of patent. In accordance with the decision

of the Supreme Court of the United States in the Singer Sewing Machine Case,\* the product is now open for competition under the name saccharin, as well as under the name benzoylsulphonic imide. No one will question the right of Merck & Co. to treat the names "benzoylsulphonic imide" and "saccharin" as synonyms. The question, therefore, resolves itself into this, namely, is it not a proper proceeding on the part of Merck & Co. to treat all other trade names as synonyms also? The product is open for competition. No one has the right to control the name saccharin. Why should any one have the right to control any other name by which the product is known? Why should Merck & Co. place themselves in a disadvantageous position commercially by recognizing proprietary claims on the part of competing houses? When the patent inhibiting the sale of the product expired Merck & Co. were forced to relinquish all proprietary claims to the name "Saccharin." Why, then, should they recognize proprietary claims to other "trade names" for the product on the part of their competitors?

The question arises in each case, is the name claimed by the manufacturer as a trademark, a trademark in fact, or merely another name for the same thing, and therefore, a synonym? This question can usually be answered without difficulty by asking another question, namely, is the name claimed as a trademark *used* by the manufacturer for the purpose of distinguishing his *brand* of the article from other brands of the same article, or is it used to give the medical profession or the public the impression that the article sold under the name is in its physiological properties and therapeutic effects different from other articles used for the same purposes? If it is a different article it is perfectly proper to give it a different name, in which case the name given it becomes public property, and all who deal in the article (and all have a right to deal in it unless restrained by patent) have a right to designate it by the name by which it is recognizable.

Names cannot be copyrighted or patented, or owned by anybody, no matter whether they are coined names or not. Every word in the language was coined by somebody and if the act of invention creates a right to the ownership of a word or a name, the entire common language in fact now belongs by right to the inventors and every time we speak or write a word or use a name, we are guilty of infringing the "vested rights" of somebody.

Armed by these facts, let us return to the objections urged by the gentleman who takes exception to our position regarding "trade names."

Our objector uses as a foundation for his argument the assumption that "Jones," having a right to the exclusive use of his own name, Jones, has also the right to designate the acetphenetidin made by him as Jones' acetphenetidin, and, therefore, the right to substitute for his own name (Jones) another name as a designating or specifying word-mark, i. e., phenacetine. This argument seems plausible, but it is unsound. Singer probably had the same idea in mind when he

---

\*DECISION OF SUPREME COURT OF THE U. S. IN THE SINGER SEWING MACHINE CASE.—The result then of the American, the English and the French doctrine universally upheld is this, that where, during the life of a monopoly created by a patent a name, whether it be arbitrary or be that of the inventor, has become, by his consent, either express or tacit, the identifying and generic name of the thing patented, this name passes to the public with the cessation of the monopoly which the patent created. When another avails himself of this public dedication to make the machine and use the generic designation, he can do so in all forms, with the fullest liberty, by affixing such name to the machines, by referring to it in advertisements and by other means, subject, however, to the condition that the name must be so used, as not to deprive others of their rights or to deceive the public, and therefore that the name must be accompanied with such indication that the thing manufactured is the work of the one making it, as will unmistakably inform the public of the fact."

It has been decided by the courts again and again that

"When an article is made that was theretofore unknown, it must be christened with a name, by which it can be recognized and dealt in, and the name thus given it, becomes public property, and all who deal in the article have a right to designate it by the name by which it is recognizable." (Lelanche Battery Co., 23 Fed. Report, 227.)

called his machine the "Singer Sewing Machine." The function of a trademark is to point out the manufacturer, or, in other words, to point out the *brand*. When a manufacturer permits his own name to become part of the name of an article it is no longer capable of pointing out brands of such article. It has become by the act of the manufacturer part of the common language and, therefore, public property.

We have many familiar examples of a person's name becoming a mere indication of a certain article or class of goods. Wellington, Brougham, Stanhope, Manton and Dover, are personal names that have given us the "Wellington boots" the "Brougham" or the "Stanhope" carriage, the "Blucher" boots, the "Manton" fowling piece, and "Dover's" powder.

The fact that a man may lose the exclusive use of his own name in connection with the manufacture and sale of an article of commerce has been decided by the courts so many times that no one versed in law would attempt to contest it. The Singer Sewing Machine case is by no means the only instance, as reference to the law libraries will show.

If our position on this subject is sound it logically follows that the names "phenacetine," "salol," "aspirin," "lanolin," and hundreds of other names appearing in medical literature and claimed as trademarks by the manufacturers, are not trademarks in fact, but appellatives and therefore public property. The Supreme Court in its Singer Sewing Machine case decision\* points out the fact that when a name has become by the consent of the manufacturer, either express or tacit, the identifying and generic name of the thing patented, this name passes to the public with the cessation of the monopoly created by the patent. The manufacturers of these products have never protested against the use of their so-called trade names by the medical profession and the public as appellatives. On the contrary, they have not left a stone unturned to force their names into scientific literature as appellatives for the purpose of converting the educational machinery of medicine and pharmacy,—colleges, text books, medical and pharmaceutical periodicals—into a great advertising bureau for commercial exploitation and free advertising. Certainly by their consent these names have become public property if the decision of the United States Supreme Court referred to means anything.

What we want to protect is not monopoly in the manufacture and sale of *products*. What we want to protect is property in *brands*. We believe that when a new chemical product is invented or discovered, the real invention or discovery is in the *way of making it*, rather than in the product itself. The science of chemistry has determined before hand that the union of certain elements in certain proportions will result in the production of certain substance, the exact composition of which every chemist has foreknowledge. But the original research necessary to work out the process partakes of the character of an invention, and the exclusive right to the process should be granted to the inventor for a definite period of years. And we believe that the manufacturer of the original brand should be protected in the use of a word-mark to distinguish his brand; also that each brand as it appears on the market should be distinguished in a similar manner.

But the product itself, and its currently used name, or names, should never be granted to the exclusive use of anybody. As stated by Browne in his work on Trademarks, such a grant "would be giving a copyright of the most odious kind, without reference to the utility of the application or the length of the title, and one that would be perpetual. Neither the trademark law nor the copyright law, nor the patent law, affords any such right, or under the pretense of the same, allows anyone to throttle trade under the alleged sanction of the law."

The word-marks "Eagle," "Star," and other brand marks, as applied to "Eagle

\*See footnote.

Brand Condensed Milk," "Star Brand Braid," etc., are not open to the objection of being the names of products. They are clearly the names of brands. In the same manner there might be several brands of acetphenetidin, as the "Phenacetine brand of Acetphenetidin," etc., etc. But the use of trade names in this legitimate fashion is not what the manufacturers want. What they want is to force their coined names into the common language as nouns, and at the same time hold on to them as trademarks. In other words, they want to "eat their cake and have it, too."

In the light of the above statement it is evident that the attempt of "proprietary" manufacturers to create and maintain monopolies in unpatented articles of commerce by claiming as private property the currently used names of such products is an invasion of public rights. Because the public is ignorant, indifferent or unmindful of its rights does not mitigate the offense in the least.

F. E. STEWART, Chairman,  
S. L. HILTON,  
W. BODEMANN,  
J. W. ENGLAND.

In this connection, the following separate statement by J. W. England is attached:

The coined name of a chemical compound becomes, by common usage, its descriptive name or title, and the granting of product-patents to inventors, as in this country, forever estops all other inventors from *marketing* the same compound, no matter how new and original their process of manufacture may be. The second inventor can patent his process of manufacture, but he cannot patent the *product*, because it has already been product-patented by the first inventor. The privilege of product-patenting is not granted in Germany and other countries; only the process of manufacture.

Thus, in our country, invention is discouraged, instead of being encouraged, and the American people are prevented from obtaining the full fruits of the inventive genius of their own inventors.

Unquestionably, when a product-patent for a chemical compound prevents the marketing of the same chemical compound made by an entirely different process of manufacture than the one patented by the first inventor, *such product should have the right of sale in this country*; and to ensure this, Congress should give the Commissioner of Patents the right to suspend the life of a product patent whenever such conditions exist. Such action would in no wise discourage invention; it would encourage it, and this is, or rather should be, the chief function of all patent legislation.

The following separate statement by Frank H. Freericks, a member of the Committee, is attached, also:

With his well appreciated kindness and consideration Chairman Stewart does not refer by name to the objector mentioned in his report. However the circumstances do not permit that I shirk the responsibility which every member of a Committee should feel.

I do not question at all the citations of Chairman Stewart made to sustain his position, but I would point out that every case which may be cited for that purpose must be regarded in the light of its particular facts. Freely do I admit, that I have not devoted the thought, time and study to this subject as has our Chairman, but nevertheless I take the liberty to point out that I am not yet willing to agree to his conclusions of what the law is.

That my position in that respect cannot be altogether wrong is best evidenced by the fact that our Chairman deems it necessary by statutory amendment to make the law what he now claims it to be. If the law now is what he claims it to be, then there would be no need for amendment. The law is common sense or ought to be. It is not in keeping with my sense of justice and with my common sense, if I have any, to make it impossible to exploit proper medicines of a proprietary character in the expectation of special profit, when such is regarded to be in keeping with the highest principles in other commercial lines. I believe that a man may serve the public quite well by introducing to them a proprietary medicine of

special merit as he may serve by acquainting them with a proprietary food of special quality. In either case I believe him entitled if he will run the risk of great loss for the purpose of introducing his article, to the exclusive profits which may result from such special endeavor.

However it is primarily my contention that we should not be concerned so much with deciding upon specific changes in the present law, until after there has been a fair understanding and agreement of what such changes in justice ought to be. I make the point that this phase has not had the general consideration which it deserves, and incline to believe that a large proportion of the American pharmacists and of the American public will be unwilling to approve some of the amendments proposed if they have a clear understanding of what they mean and lead to. In my humble judgment this Committee should seek to bring about a better understanding of the facts, and when an understanding of the facts has been generally arrived at it will be time to turn to legislative remedy for evils which may be agreed to exist.

H. R. 19187.

In the House of Representatives, October 8, 1914, Mr. Paige of Massachusetts introduced the following bill; which was referred to the Committee on Patents and ordered to be printed.

A BILL—To amend sections forty-eight hundred and eighty-six and forty-eight hundred and eighty-seven of the Revised Statutes, relating to patents.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That section forty-eight hundred and eighty-six of the Revised Statutes, as amended by Act of Congress approved March third, eighteen hundred and ninety-seven, be, and the same is hereby, amended so as to read as follows:

"Sec. 4886. Any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country before his invention or discovery thereof, and not patented or described in any printed publication in this or any foreign country before his invention or discovery thereof or more than two years prior to his application, and not in public use or on sale in this country for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fees required by law and other due proceedings had obtain a patent therefor: *Provided*, That no patent shall be granted on any application filed subsequent to the passage of this Act upon any drug, medicine, medicinal chemical, coal-tar dyes or colors, or dyes obtained from alizarin, anthracene, carbazol, and indigo, except in so far as the same relates to a definite process for the preparation of said drug, medicine, medicinal chemical, coal-tar dyes or colors, or dyes obtained from alizarin, anthracene, carbazol, and indigo."

Sec. 2. That section forty-eight hundred and eighty-seven of the Revised Statutes, as amended by Act of Congress approved March third, eighteen hundred and ninety-seven, and as further amended by Act of Congress approved March third, nineteen hundred and three, be, and the same is hereby, amended so as to read as follows:

"Sec. 4887. No person otherwise entitled thereto shall be debarred from receiving a patent for his invention or discovery, nor shall any patent be declared invalid, by reason of its having been first patented or caused to be patented by the inventor or his legal representatives or assigns in a foreign country, unless the application for said foreign patent was filed more than twelve months in cases within the provisions of section forty-eight hundred and eighty-six of the Revised Statutes, and four months in cases of designs, prior to the filing of the application in this country, in which case no patent shall be granted in this country.

"An application for patent for an invention or discovery or for a design, filed in this country by any person who has previously regularly filed an application for a patent for the same invention, discovery, or design in a foreign country, which, by treaty, convention, or law, affords similar privileges to citizens of the United States, shall have the same force and effect as the same application would have if filed in this country on the date on which the application for patent for the same invention, discovery, or design was first filed in such foreign country: *Provided*, That the application in this country is filed within twelve months in cases within the provisions of section forty-eight hundred and eighty-six of the Revised Statutes, and within four months in cases of designs, from the earliest date on which any such foreign application was filed. But no patent shall be granted on an application for patent for an invention or discovery or a design which had been patented or described in a printed publication in this or any foreign country more than two years before the date of the actual filing of the application in this country, or which had been in public use or on sale in this country, for more than two years prior to such filing: *Provided, however*, That in case any drug, medicine, medicinal chemical, coal-tar dyes or colors, or dyes obtained from alizarin, anthracene, carbazol, and indigo, on which a patent for a definite process for the preparation thereof has been granted on any application filed subsequent to the passage of this Act, is not manufactured in the United States by or under authority of the patentee, within

two years of the granting of said patent, and after the commencement of said manufacture the same is not continuously carried on in the United States in such a manner that any persons desiring to use the article may obtain it from a manufacturing establishment in the United States, then said patentee shall have no rights under the patent laws of the United States as against any citizen of the United States who may import such drug, medicine, medicinal chemical, coal-tar dyes or colors, or dyes obtained from alizarin, anthracene, carbazol, and indigo into the United States or who may produce or manufacture the same in the United States or who may handle for sale or use such article so imported or manufactured."

Chairman Freericks: You have heard the report of the Committee on the Revision of the Trade-mark and Patent Laws. What is your pleasure? First of all it will be proper to make a motion of some sort with reference to the report as it is now before you, and it will then be open for discussion.

Dr. Anderson: I have not a patent or trade-mark on these motions, Mr. Chairman, but I think it is necessary to have a motion in reference to it. Therefore, I move that the report be referred to the Committee on Publication. Seconded by Mr. Phillips.

Chairman Freericks: The Chair will ask his associate to act for a short time. Miss Zada M. Cooper then presided.

#### ABSTRACT OF DISCUSSION

G. H. P. Lichthardt: Two or three years ago I became quite interested in the subject of trademarks and patents as regards the granting of trademarks and patents on medicinal products; and I went quite thoroughly into the matter and corresponded with Chairman Stewart and he was quite kind enough to send me some rather lengthy communications on the subject. And after I had spent a good deal of time and effort I knew very little about the subject, in fact, very little more than when I started, that is, from the practical standpoint, and I feel quite as helpless today. I would like to get, in condensed form, the gist of the actual situation under our present laws, and what might be accomplished, what it is aimed to accomplish, or what is aimed to be accomplished in correcting those laws where they need correction.

I hope the discussion will bring out something really helpful and something that the ordinary layman can understand on the subject. This question of trademarks not only affects the American pharmacist, but the American Medical Society is working on it and has been for a long time. I think as long ago as 1912 the then President of the United States, William Howard Taft, spoke to the Section on Applied Chemistry and Patent Laws.

It seems to me, that the trademark, is simply a notice to the world that you have adopted thus and so. I am not very familiar with the national trademark laws, but I think the state laws are somewhat similar. It is not the name that you trademark, but it is the way it is written. I have several trademarks myself, and it is the design that you trademark and not the name. Is not that your understanding of it, Mr. Freericks?

Mr. Freericks: That is correct with reference to trademark, yes. I do not want to take up much time to refer at length to the subject. I feel rather out of place in speaking on it at all since Chairman Stewart is not here. It would be very much better if he were here, for then the discussion would not be a one-sided affair. I think Mr. England is much in accord with the views of Dr. Stewart and possibly he will do all the calling down that can be done. I am heartily in accord with the proposition that our patent laws should be amended along the line as just pointed out by the previous speaker, but my point first of all is that we have been devoting years and years discussing patent and trademark cases and you can ask wherever you will and nobody knows anything about it. They are all ready and willing to have the patent and trademark laws changed. But it is not the proper way of getting at the thing; it is a serious, very serious matter. My point is that we should know more about the facts of the trademark and patent laws, and we should not simply start off by leaving it to the Committee and taking it for granted that that Committee is properly going to represent this body. It is not fair to the Committee. It is not fair to the pharmacists of the country. It is not fair to the public, and it is not fair to ourselves.

And now with respect to the point raised about the trademarks: It is quite right. A trademark is truly a mark of some sort, some individual design that can be claimed to distinguish one man's goods from another man's goods.

But do you know that it is the tendency of your committee and others to take a wrong position,—now, I am going to name a substance,—not because I favor it particularly but it just come to my mind.

Do you believe it best, do you believe it fair, that after millions of dollars possibly have been spent to place a proprietary before the public of this country that you and everyone else should make this preparation?

Now, that is exactly what is proposed and I think it is unfair, and there is where we are making the mistake.

It affects every retail pharmacist in this country.

Many of you have preparations that you take pride in and that you have a right to take pride in. Do you think it unfair or not, that your neighbors and others should go out and make that preparation? If it had not been for you the public would not have had that merited product. And when I do that, I have taken the risk; it has been my money that has made that material known to the public, and it is nothing short of robbery to take that away from me. It is this view that I am trying to bring home to you. And if you pharmacists are not careful, you are going to have an amendment in the trademark laws of this country that will make that possible.

Mr. Binz: I heartily concur in the general statement because I have had some experience in trademark goods. I do not want you to infer from that, that I want to advertise my business at all, but it just happens to be an instance that will bring this home.

I happen to get out an Oil of Eucalyptus in the southern part of the state, an Oil of Eucalyptus which is better than the ordinary run of Eucalyptus. I have spent about five years detailing this oil among the physicians. I used no trademark. I have been sorry for years past that I did not do so.

You can go from one druggist to another and you can pick up perhaps twenty grades of eucalyptus oils and no two of them are distilled from the same variety. That is one reason why I have fallen down with the higher grade of eucalyptus oil. I did not have protection. I think that any man who makes a specialty of an article should be protected with a trademark, for the druggist never will protect him.

Mr. G. H. P. Liehthardt: I feel we are getting at least some definite expression on one point: That is, regarding copyrighting specific names, proprietary names. I agree with our Chairman, when a man spends a great deal of money in advertising a product that he ought to be protected; that when this preparation is prescribed or ordered, it should be supplied every time; but I do not believe that because this certain named compound has been exploited,—that we should prevent anyone else from putting up a similar compound and marking it under some other name. As regards Mr. Binz: He could market his product as "Oil of Eucalyptus,—Binz," and the druggist is bound to dispense the product when it is so prescribed, otherwise he is substituting. But he should not be protected in giving him a monopoly, preventing others from putting up oil of eucalyptus, or an oil which might be superior to his oil of eucalyptus, and prevent you from getting such a product. I do not just know how those points are covered by our present patent and trademark laws.

I would like to ask if there ever has been any effort made to run down the status of the trademark, that is, in the legal way, having a committee appointed to really find out what it is and where it is and where we are?

Mr. Freericks: The Chairman of this Committee, Dr. Stewart, has been at work on that for years, and for the information of all, I would say that of the many men connected with pharmacy there has been no one who has given that matter more study than Dr. Stewart has given it.

As is so often the case, and that is where we make our mistake, we appoint a committee, and the committee seeks to do its work, but the Chairman after all is the one who must do the greater part of it.

I merely call it to your attention and I apologize for expressing a personal opinion now; but the trouble is that the Committee has not been given sufficient authority; the difficulty is

that the committee on trademark and patent law revision has not been given the proper scope; that is, the membership has not given that committee, and particularly the Chairman, the attention that he has a right to ask for and he ought to have.

And if upon the report that the Chairman of the Committee on Trademark and Patent Law Revision makes annually, there would be the right discussion and expression of opinion, and if the membership generally would study the subject, in two years the pharmacists of this country would thoroughly understand the trademark and patent laws and the changes that ought to be made.

But each of you, I am sure, who have been connected with the Committee, have found yourselves doing faithful work and piling up much in the way of statistics and valuable information, and when you make up your report everybody is really pleased and they say, "Yes, we will receive it and approve it," but that does not help your committee.

It is agitation, a difference of opinion, that will bring that out, and I am hopeful that that will be done in the next year, and then, I am sure, we will understand the patent laws and trademark laws as they ought to be understood.

General Secretary Day: I have been very much interested in this subject, although, in common with some of the others present, I have not a very deep knowledge of it; but there is another phase to the proposition presented by the Chairman so ably.

With regard to a proprietary, ought there not be a limitation as to time for which a trademark would hold good? Isn't it a fact that trademarks now are practically perpetual?

After a time the trademarked word may become a common word of the language, and then have we not a right to provide for the use of similar preparations under that established name? There is a question whether we ought not be permitted to put on the market our own brands of certain proprietaries, after the preparation has reached a degree of common usage which brings the word into the language as a common word.

Mr. Lichthardt: Now, that is something definite: If a trademark confers perpetual rights under our trademark laws then the law in that respect should be amended, as Professor Day points out, so that a phrase or word that becomes practically part of the English language,—common usage—does not confer perpetual proprietary rights in that article. Now, that seems to be a perfectly clear proposition. While I have the floor I am going to dwell on another phase of trademark and patent laws, and I think the present time is the psychological moment to spring trademark changes and patent changes on the United States Congress because of the European war. I have particularly in mind the situation as regards chemicals, particularly German chemicals patented in the United States. Take for example, Salvarsan: Salvarsan is patented in this country also trademarked and copyrighted; I know it is fully protected.

While the originators of Salvarsan are protected in every possible way by the United States, the United States is not protected in any sense. We can not manufacture Salvarsan in this country. And our trademark laws evidently do not provide that the product should be manufactured in this country after a reasonable time; a reasonable time after the granting of the patent as is the case in some other countries, namely, England and France, I understand.

Now, they are making Salvarsan in Japan; making it in two or three different cities in Japan, and they are deriving the benefit of Salvarsan there, as they are also in Great Britain, where they are making Salvarsan and bringing it out under a different name, but at the same time, they are making it.

Here in this country we are absolutely helpless; even though we could make it, we are not permitted to, and moreover we are not permitted to import Salvarsan, which is made in Japan or Great Britain. I think there is something radically wrong.

We not only grant the trademark or patent privileges, but we also have to pay an excessive price.

There seems to be something very necessary there in the amending of our patent law. Of course, I do not pretend to be familiar with the subject, but it would seem to me that a very necessary amendment to our patent law is, that where a foreign product is protected by a United States patent, that product should be made in this country, so that when a condition occurs as at present in Europe, we can make the product and give the people who need that

product, that particular chemical, the opportunity of using it without being charged an excessive price for it.

Mr. England: I have listened to the discussion which took place from the different angles, and I am more than sorry that Dr. Stewart is not present to give us the benefit of his very wide knowledge on the subject. He is a walking encyclopedia on the subject of trademark and patent laws, and I could not begin to express his opinions here. It requires a man on the ground who has the technical education today to give a correct opinion.

The ground has been so fully covered by Mr. Day and Mr. Lichthardt that I do not think it is necessary to refer to the phase of the discussion covered.

Just one thought: And I think Mr. Lichthardt has struck the crux of the whole situation in that respect. He cited Salvarsan as a common example, as an illustration of patent misuse.

The *process* for making Salvarsan is patented in this country. Salvarsan as a *product* is patented in this country. The *title* is copyrighted in this country or given the protection of a trademark.

If some country discovered a new method of making it they couldn't patent it or sell the product, and it seems to me that is one feature of the patent laws which needs correction; and the one feature which particularly needs correction is the amendment of the *patent product law*.

This country stands face to face with a great dearth of coal tar products. Many of these are patented in this country, and, as Mr. Lichthardt shows, they can be made in Japan and they can be made in England and France, and they can be imported into this country, but not sold, because the products are patented.

If we are going to develop restrictions in this manner around industry in this country it will result in its being stifled. I believe we shall have to amend these laws so as to give to our manufacturers the same right that Germany gives its manufacturers. Germany has no product patent law. England has no product patent law.

In order to stimulate our chemical industries, we will have to amend our laws; it will be necessary to adopt some law of protection.

I believe in protection, protecting the men in the industries. I do not believe we will ever have development of the chemical interests of this country until they have full protection.

Note the difference between the wages that the German laborer or employee receives and the corresponding difference between the American laborer and employee.

In Germany chemists command very small salaries, but in this country relatively high salaries are paid and they are scarce at that.

The raw materials cost about the same. Much of the raw material Germany uses in the making of chemical compounds comes from this country.

Mr. Binz: I think, as Mr. England does, and Mr. Lichthardt, that the amendment should be predicated in the patent law, like the copyright and trademark law. I think the copyright and trademark law is just to the manufacturer, but I do not think the German chemist should be allowed to patent his product or his way of manufacturing and prevent it from getting into the United States, or prevent it from being manufactured.

Mr. Freericks: Not to take up any further time on that point, but to make one point clear, I would say that there is a distinction between the registration of a label and a trademark. We have the two provisions, and we may have the registration of a label or the printed name appearing on a label, and we may have a trademark; but a trademark is altogether different from the registration of a name. I merely speak of that so there will be no misunderstanding.

The vote was called for and carried.

Mr. Freericks then resumed the Chair.

Chairman Freericks: The next paper will be the report of the Committee on Drug Reform. This paper or report is presented by Chairman L. E. Sayre of that Committee.

Chairman Freericks then read the report.

## REPORT OF THE COMMITTEE ON DRUG REFORM

For the fifth time, your Committee on Drug Reform offers to the Association an annual report. From the first year of its appointment by President Rusby, the Committee has groped its way hesitatingly, as in darkness, not having a clear definition as to its function. Former reports will show that the Committee has outlined its own course and prescribed the limits of its works.

The Committee has endeavored to keep in touch and, as far as it was able, work with those who were promoting better and more uniform legislation in Food and Drug Control; with those who were endeavoring to promote a better and higher education for pharmacists, and to offer its help in promoting the cause of drug culture in the United States. The term "Drug Reform," to make it comprehensive, might mean anything that would tend to improve present conditions in the whole realm of pharmacy, but to act on such a broad program at one time would simply lead to ridiculous superficiality and, therefore, your Committee has concentrated the little work it has done in a very few directions only.

It may be said in passing that a letter from one of the members of the Committee, Albert Schneider, in reply to a request for his contribution to this report, says: "I am now engaged in preparing a bulletin on the *Cultivation of Belladonna in California* which will be published by the University. This bulletin will be the theme of my report on the cultivation of medicinal . . . . This phase of the report, your Chairman suggested to Professor Schneider to be his contribution. Professor Schneider has certainly had every experience in this work, contributing time and money to the same.

Your Chairman endeavored to secure through legislation in Kansas a new Pharmacy Law, which was considered by the legislative committee a model law, improving the present law now in force. The legislator, who was a pharmacist and who had in charge this model law, insisted that there should be a provision in it that the registered pharmacist and the assistant pharmacist should have pursued to successful conclusion a course of four years' high school study, or its equivalent. The Chairman advised him that he thought this would be opposed. The law also provided that every dispensing practitioner of medicine should keep a copy of his prescriptions in his office for at least two years. The doctors of medicine of the Committee on Hygiene and Public Health gave their support, believing that it would be objected to only by lazy physicians. The Section IX also provided that the regulation under which the State Board of Pharmacy is now operating, permitting it to issue a merchants' license to others than registered pharmacists when there is no pharmacist within four miles of such a merchant's place, should give authority to sell the usual domestic remedies and medicines in unbroken packages, not including any article included in Schedules A and B of the Pharmacy Act. Other sections of the bill refer to the sale of narcotic drugs and were framed to meet the requirements of the Harrison Law. Mr. C. A. Mosher, who was the champion of the bill, a pharmacist, writes of its fate in substance, as follows:

Referring to the vigorous attack of the legislature he says:

"The first gun fired against the bill threw a shot from miles beyond our ken into the high school requirement. One ally thought that high school graduates should be reserved to fill up the ranks of school marms as fast as decimated by stenography and marriage. Another thought that high school graduates 'ought to be taught to plow.' And all were agreed that my maids and lads did not need more than 'Readin', Ritin', or 'Rithmetic' to permit them to thrust their hands into the intricate mechanism of health and life.

"The various death-dealing missiles were thrown thick and fast—the legislators called them amendments; the first of these read as follows: 'All persons, firms, or corporations are hereby prohibited from selling or keeping for sale in any drug store in this State, any goods, wares, or merchandise other than medicines as defined in this act.' This shot almost 'killed the bill,' but a final blow was struck by one who has stood as a legal protector of the

drug peddler, and the legislative oppressor of physicians and pharmacists of Kansas. This final blow was presented in the form of another amendment reading as follows: 'Providing that nothing herein contained shall be construed as requiring a pharmacist, registered under existing law, *or having practiced pharmacy as proprietor in Kansas for ten years*, to take an examination.' This motion, having passed, was followed by a final one to strike out the enacting clause—which put the almost lifeless thing out of its misery."

In connection with the anti-narcotic law, your Committee has had considerable correspondence and has endeavored to give instruction in regard to it to those who were not clear in their mind as to its varied application. Your Chairman has met with various local medical organizations, to which pharmacists have been invited, where the law has been under discussion. So much active interest has been evinced in this restriction of sale and distribution of habit-forming drugs that we are now facing a mass of legislation which calls for an effort to produce uniformity—one that will promote the effective coöperation and harmonious regulation of commerce in the handling of narcotic drugs throughout the United States. So much has been said in the Journal of this Association and current pharmaceutical magazines in regard to bringing all State laws in conformity with the Harrison Act, that your Committee believes it unnecessary to do more than call attention to the draft of what is known as the N. A. R. D. State Antinarcotic Law prepared by a committee consisting of Dr. J. H. Beal, Frank H. Freericks and Hugh Craig; this draft is intended "to serve as a body of well considered provisions from which selections may be made for use in states where existing laws need to be revised." In this connection, attention should be called to articles published in the Journal of this Association (June, 1915, Pp. 702 and 707), by M. I. Wilbert and Charles Wesley Dunn. Mr. M. I. Wilbert says, in his contribution, in regard to "greater uniformity," it should be borne in mind that the Federal Antinarcotic Law is not restricted to Federal territories and to inter-state commerce, but is uniformly applicable and in force in all parts of the United States, therefore it is manifestly unnecessary to reenact in the several states any part or all of the Federal Antinarcotic Law. Such enactment would only tend to duplicate the penalties that might be imposed.

Mention should be made also in this connection, of the activity of special committees of the Chamber of Commerce of the United States, a report from which has recently been issued on "A Proposed Uniform State Narcotic Law." Mr. B. L. Murray, of Merck & Company, is Chairman of the Sub-Committee on Drug Control. Your Committee has been in correspondence with him and desires to recommend that your future Committee shall, in every way consistent with its functions, coöperate with him and other agencies which may tend to bring about the end above mentioned.

Confirmatory to the Sherley law, a far-reaching legislative act (Senate Bill No. 229) was passed by the recent Kansas legislature which makes it a criminal offence to publish or circulate in the state, whether by newspaper, by label or otherwise, any statement regarding merchandise offered to the public, which is in fact untrue, deceptive or misleading. It will be interesting, to say the least, to see how far-reaching this new law will be when applied by the proper authorities. It suggests to our minds the idea which Prof. James H. Beal had in his address before the North Carolina Pharmaceutical Association under the caption of "A Fury for Legislation." He says in substance: "We have drifted from 'the largest field for individual initiative and the most untrammelled opportunity' into that of making 'each citizen a ward of the state and to guard and direct his every act and ambition as if he were an irresponsible and heedless infant.'" On the other hand we may say in reply to this idea that present restrictive legislation is exposing the abuses of the unscrupulous, who have taken advantage of the freedom vouchsafed us by our forefathers, and the present paternal regulation, which we shall have to bear with patience, is a burden thrust upon us by our common humanity.

It is perhaps unnecessary to say, in regard to the Stevens' Bill, that the drug trade is enthusiastically favorable to it. It will aid those who are obliged to cut prices for self-protection as well as those who are resisting the pressure to do so for the same reason. One of the most prominent of price cutters in Kansas stated to your chairman that he would vigorously support the Stevens' Bill—that he had never cut prices from choice but was forced to it by department stores, which employed this means of advertising.

To all concerned, it should be stated again and again, that this bill will *never* become a law unless retailers exert themselves and give active moral support to those who are endeavoring to promote its enactment.

There are many topics which your committee might present for study of the future Committee on Drug Reform. Your chairman will endeavor to name some of these:

1. The average druggist is showing less and less originality in his profession: is depending more and more, entirely upon the manufacturer even to the purchase of such preparations as Tincture of Ginger and Essence of Peppermint. What may this Committee do to remedy this loss of originality and initiative leading eventually to complete atrophy?

2. The handling of remedial agents by wholesale and retail grocers is becoming more and more pronounced, leading to the distribution of substandard and deteriorated goods such as sweet spirit of nitre, hydrogen peroxide, etc. What may be done along legislative lines to prevent this injustice to the public?

3. Many of the nostrums formerly advertised in the daily papers, such as crystos, spurmax, etc., also articles consisting of inexpensive ingredients having exorbitant prices, are becoming to an extent controlled by the application of the Sherley Act. What may be done by your future Committee to urge the more general application of this Act?

4. Grave injustice is caused to the public by advertisements in cheap magazines and some of the lodge journals which continue to publish fake medicine advertisements; for example, Dr. Grain's cure for deafness (found to be a solution of potassium iodide). For the betterment of such conditions this Association should systematically co-operate with the work of the American Medical Association.

The report of the British Pharmaceutical Parliamentary Conference on Proprietary and Patent remedies, a summary of which was published by J. H. Beal in the February issue of the Practical Druggist, should be studied by every pharmacist. The findings of this committee are not by any means encouraging to the proprietary and patent medicine interests. The recommendations of this committee seem to your chairman fair and even liberal. We would recommend that this report of Professor Beal's be reprinted in the Journal of this Association and widely circulated.

Respectfully submitted for the Committee,

L. E. SAYRE, Chairman.

Chairman Freericks: You have heard the report of the Committee on Drug Reform, and it is before you. What is your pleasure?

General Secretary Day: I move that the report be accepted and referred to the Committee on Publication, and that the recommendations be approved.

The motion having been regularly made and duly seconded, and the question put, the same was declared carried.

Chairman Freericks: The next order of business is a paper by Prof. Army.

Prof. Army: I move that it be read by title and referred to the proper committee for publication.

The motion was seconded by Mr. Binz, and the question having been put, was declared carried, and the paper was read by title and referred to the Committee for publication.

Chairman Freericks: The next paper is by Wilhelm Bodemann, and since the Chair feels deeply obligated to Mr. Bodemann for writing this paper, he would ask the privilege of reading it.

After discussion the paper was referred to the Publication Committee.

Chairman Freericks: The next paper is by Mr. Hugh Craig on the N. A. R. D. model anti-narcotic bill, a subject in which we are all interested. Mr. Thiesing is here and he has kindly agreed to read this paper for Mr. Craig.

#### THE N. A. R. D. MODEL FOR A STATE ANTI-NARCOTIC LAW

HUGH CRAIG, CHICAGO.

Because of the many requests received at the office of the National Association of Retail Druggists from pharmacists interested in legislative activities in their respective states, who desired some basis for the construction of a state law to supplement the federal anti-narcotic statute, and in recognition of the fact that the soon-to-open sessions of some forty state legislatures would be the occasion of a multitude of endeavors to put some sort of anti-narcotic measure upon the statutes, the N. A. R. D. executive committee, at the meeting held in December, 1914, invited Dr. J. H. Beal, Frank H. Freericks, Esq., and Hugh Craig to serve as a special committee to prepare a draft of a model for a state anti-narcotic law. The outcome of the endeavors of this committee was the draft which has come to be known as the "N. A. R. D. Model Anti-Narcotic Bill," the name being a bit inappropriate as the draft is not advanced as a model bill but as a model for a bill. This draft has been printed in full in the *Journal of the American Pharmaceutical Association*, in the issue of May, 1915; and in the same issue of the *Journal*, appeared an able analysis of its provisions by Dr. J. H. Beal. Any detailed reference to these provisions is, therefore, herein unnecessary, and such reference as needs be made to them will, of course, be a repetition in part of the text of Dr. Beal's article.

In the first place the purpose of the N. A. R. D. draft is to promote uniformity among the anti-narcotic laws of the several states and the Harrison law. Uniformity, with reference to the several states, is very important because of the unavoidable condition of law-evasion which obtains near the borders of two or more contiguous states whose statutes do not provide equally for the regulation and restriction of traffic in narcotics. If a person may cross from New York to Jersey City, or vice versa, and in the latter city obtain narcotics more readily than in his home community, and carry them into New York to dispose of them in an illegal manner, the effectiveness of the New York regulations is seriously impaired, despite the attempt at the restriction of interstate traffic made in the Harrison law. At best only the illicit distributor can be apprehended and punished; the source and channel for further traffic are not closed. The necessity for uniformity in general provisions of a state law and the federal act is clear to anyone who has had to attempt compliance with different provisions.

In appreciation of the fact that many existing state laws need but slight alteration to make them effective supplements of the federal act, the committee constructed a somewhat expanded form of draft from which desirable sections might be selected as amendments to the existing law. This form of draft was also considered best adaptable to revision as necessitated by local conditions or desires, because changes in any one or several provisions or their deletion would not effect the general purpose of the draft or disrupt its coherence.

The committee had in mind the necessity for the regulation of every channel for the distribution of narcotics and, as well, that for reducing to a minimum the opportunity for possessing these substances for immoral and illegal purposes. It is this last-mentioned necessity which, above all others, justifies the preparation of this draft. Many have argued that the federal anti-narcotic law

removes the necessity for state laws relating to the traffic in narcotics. This willingness to hand over to a paternalistic federal government the entire regulation of an intrastate practice is too patent an indication of a let-the-other-fellow-do-it attitude, a too complete relinquishing of state's rights. Also there is every indication that the federal law, in its provision to restrict the possession of narcotics, not had for purposes of sale or other disposal, constitutes an illegal encroachment upon the rights of the several states. Already the majority of decisions in the federal courts have been antagonistic to this extension of federal supervision. Not alone in this but in a number of other instances is it clear that intrastate traffic in narcotics can more effectively and more reasonably be regulated by a properly constructed state law than by the Harrison law and the regulations incident thereto.

In one point at which the N. A. R. D. draft differs from the federal law and on which the Harrison law has been assailed with an apparent indication of the act being changed, is the regulation of the dispensing of narcotics by a physician. It seemed to the committee that to discriminate against the exclusive office practitioner, whose numbers are large in every city, was uncalled for, and that the distinction in this regard should be drawn along the same lines as the exemption of preparations. Therefore the exemption of the physician, proposed by the committee, is based upon the quantity of the narcotic disposed of. These quantities are arbitrary, although sufficient for every legitimate purpose, and may, of course, be changed to suit the ideas of pharmacal bodies in any particular state.

The prescribed preparation is not discriminated against in this draft, as is, unfortunately, the case in the Commissioner of Internal Revenue's interpretation of the Harrison law. In general, the treatment of the dispensing of narcotics in pursuance of prescriptions is the same in this draft as in the state laws of recent enactment, although a stricter accountability is laid upon the possessor of narcotics, who might allege that they were obtained in a legitimate way, by specific requirements relative to the labeling of drugs dispensed on a prescription and possessed in consequence of such dispensing. Pharmacists are relieved from responsibility for the authenticity of prescriptions if they have exercised due care in the scrutiny thereof.

In the matter of exempting preparations containing minimum quantities of narcotics, the N. A. R. D. draft obviates the condition which was largely responsible for Treasury Decision 2213, denying exemption under the Harrison law to extemporaneous prescribed preparations, by providing that exemption shall extend only to preparations which contain other medicinal substances in admixture with the narcotics. The exemption also applies only to preparations containing but *one* of the opiates in the specified proportion (the same as the Harrison law). The right to sell these preparations is not, however, extended indiscriminately, itinerant vendors and storekeepers located less than a mile distant from a drug store or a physician's office being denied this right, and storekeepers located so as to escape this prohibition are required to obtain a license from the state board of pharmacy. A similar license is required to be obtained by wholesale dealers, manufacturers, and hospitals which do not employ a licensed pharmacist, physician, dentist, or veterinarian to supervise the handling of narcotics.

Specific definition is given of all those who in any manner may deal in or possess narcotics and also of their respective rights. Misrepresentation for the purpose of evading these definitions is made illegal. In this manner the operations of bogus concerns and the assumption of false professional titles is guarded against.

In making proof of possession *prima facie* evidence of dealing in the prescribed substances, in providing for the punishment of individual members of firms and corporations and of agents, and in relieving prosecutors from the

obligation of negating exemptions, the draft does much to assure the effective enforcement of its provisions. The enforcement of the provisions is entrusted to the state board of pharmacy and public prosecutors, the board of health being given power to supervise the practice of physicians in the treatment of addicts to the use of a narcotic. There can be no question but that the efforts of the board of pharmacy in connection with the enforcement of an anti-narcotic law will be received with better grace by pharmacists, than would the efforts of a board of health, because the former body may more reasonably be expected to have the peculiar appreciation of pharmaceutical practice, and medical practice as well, which is so necessary to guard against unreasonable procedure. That the assistance of public prosecutors is necessary need but be mentioned in view of the general recognition of the limitations of boards of pharmacy in funds and agents.

Constructed with an ever-present purpose to correlate effectiveness and reasonableness, the N. A. R. D. model for a state anti-narcotic law affords a valuable basis for the work of legislative committees of pharmaceutical bodies, who are confronted with the necessity of preparing a draft for a state law to meet a widespread demand for the enactment of anti-narcotic legislation, or are disturbed by the furtherance of measures of this sort, by well-meaning but poorly informed advocates. The draft is not offered as an ideal model; but, as a foundation for real constructive work, it offers the result of careful deliberation. Insofar as the committee which framed it and the association which stands sponsor for it are concerned, there is no intention of cramming the full, unrevised text of this draft upon any who may be engaged in the consideration of anti-narcotic legislation, and assistance will be gladly extended to those who desire to make changes in it.

Chairman Freericks: You have before you the paper of Mr. Hugh Craig on a model anti-narcotic law. What is your pleasure?

Mr. Weinstein: I move that it be received and that it take the usual course. Motion seconded by Mr. Binz.

Chairman Freericks: Are there any remarks?

The motion having been regularly made and duly seconded, and the question called for, the same was declared carried.

The next paper is by Dr. Fischelis on "Providing Needed Education."

Professor H. V. Army then read Dr. Fischelis' paper. This paper was published in the October number, page 1235.

Chairman Freericks: You have heard the paper, what is your pleasure?

Prof. Army: I move that it be referred to the Committee on Publication because it should not only be published, but there may also be some ideas contained therein worth considering.

President Mayo: I suggest it be referred to the Committee on Publication with the approval of the Section; the added suggestion that it was approved by the Section would cover the ground.

Seconded by Mr. F. W. Nitardy.

Mr. Liehthardt: There are two very excellent ideas in it. First, to send out these bulletins to the newspapers. It will probably have to be done in a small way at first, and sent to the very prominent papers. It is a very excellent idea. That is the way to deal with the problems that we were dwelling upon a little while ago with respect to the dispensing physician.

Now, on the matter of abstracts. In the Scientific Section we prepared abstracts; that is, Mr. England and myself, on all the papers but two, I think, which

were submitted and the authors of which were absent, and instead of just reading the paper by title we read the abstracts and it gave those present an idea of what the paper contained. It is a much better idea to prepare the abstracts and publish them in the Journal before the meeting, and it will very likely do away with some objectionable papers.

The motion having been regularly made and duly seconded, and the question put, the same was declared carried.

Chairman Freericks: There has been referred to this Section from the Commercial Section, that is, from the general session to the Section on Education and Legislation, and then to the Commercial Section and from the Commercial Section to this Section, a most interesting paper by Dr. A. O. Zwick of Cincinnati. The Chairman of your Commercial Section and your present Chairman feel under obligation to Dr. Zwick because this paper touches upon a subject of vital concern to pharmacy as treated by a physician.

This paper is really presented in answer to the raising of the question as to whether prescription charges,—the prices as fixed on prescriptions—have not something to do with the growing evil of dispensing by physicians. The paper does not answer the question either one way or the other directly; but that was the thought, and I want to submit it to you for future consideration, to let you know how important a thought it is.

Moved by Dr. Anderson, and seconded by Mr. Nitardy, that the paper take the usual course.

Chairman Freericks: Now, the last thing on the program, outside of the election of officers, is the report of the Voluntary Conference for Drafting a Modern Pharmacy Law.

We appreciate fully what is necessary in order to take up the subject intelligently, but a report has been prepared showing the progress of the work to date, and I believe it will be interesting.

#### REPORT OF THE VOLUNTARY CONFERENCE FOR DRAFTING MODERN LAWS PERTAINING TO PHARMACY.

F. H. FREERICKS, CHAIRMAN.

Impressed by the frequently expressed need for greater uniformity in the several state laws concerning pharmacy, and for making such laws more in keeping with general advancement and progress, the Chairman of your Section on Education and Legislation by and with the co-operation of his associates and the Secretary undertook to commence that work. It was agreed that a very general interest from every state would need to be created and to that end it was deemed essential that the co-operation of every state association and state board of pharmacy should first be sought with a view of forming a voluntary conference in which every such state association and state board of pharmacy would be represented by one member.

Shortly after the last annual convention of the A. Ph. A., at Detroit, the Chairman of your Section submitted an outline of the intended work to the presidents of every state pharmaceutical association and state board of pharmacy, and requested each of them to name a representative for their respective association or board, who together would then constitute a voluntary conference under the auspices of the Section on Education and Legislation. Almost without exception the responses were most hearty, and the interest shown most general.

Some few pointed to the fact, that in the states from which they came the present laws were fairly satisfactory, but in such cases in keeping with the great majority who responded it was agreed that more uniformity in state laws was highly desirable, and new features might be added in order to better safeguard the public interests and welfare. It is with no small measure of satisfaction that we point to the fact that forty-two (42) state pharmaceutical associations, and forty-four (44) state boards of pharmacy through their presidents appointed members to the Voluntary Conference. The list of members so appointed is separately shown in connection with some new provisions now under consideration by the Conference, and which are attached to and made a part of this report. It should in that connection be mentioned that owing to the death of Mr. James O'Hare of Rhode Island, President Armstrong of the Rhode Island Association named Mr. Frank A. Jackson to fill the vacancy thus created. Owing to the inability of Prof. Hemm of Missouri to further serve, the vacancy thus created was filled by the appointment of Mr. Chas. E. Zinn.

In outlining the work of the Voluntary Conference it was at first thought possible to present a complete draft of laws pertaining to pharmacy at this meeting to be expressive of the best opinion of at least a majority of the Conference members, but within the past six weeks this has been found to be hardly possible and certainly inadvisable. After the Conference members had been generally appointed they were requested to submit changes which they deemed necessary in their respective present state laws and to suggest new features for a compilation of modern laws such as they deemed desirable. Responses in this connection were quite general, and temporarily holding in abeyance the amendments thought necessary to the existing laws in different states, attention was first given to the new features which seemed desirable. Suggestions for such new features were put together and then again submitted to all of the Conference members, to find a fairly general approval. After such fairly general approval of such suggestions they were drafted into more concrete form so as to secure an idea as to the scope and extent which might meet with the views of the membership. Unfortunately because of the mass of correspondence and the incident delays which always come when many are concerned, it was not possible to present these new features in such concrete form in time to have them find consideration at all of the state meetings held within the past two or three months. In some few states where they reached in time and where they might have been considered, the work already outlined for the conventions made it impossible to give the necessary consideration, while in other states they were most thoroughly considered and discussed. Since a complete draft of laws will be largely dependent upon the new features, which are found desirable, and since it is deemed of prime importance that such new features be discussed at this convention, it has therefore been decided that they should at this time be first and separately submitted, together with such criticisms and suggestions as have been made by state associations and state boards which have found opportunity to consider them. There are eight of such new provisions at present under consideration, and these are in printed form and have or will be distributed to all who are now present, so that they may find intelligent consideration and discussion, properly constituting a part of this report as already stated. It must be understood that the separate provisions as herein and herewith presented have not been put in their final and most concrete form, the thought being to simply submit a fair outline for ready understanding, and even if the separate provisions meet approval, in their present form, it is deemed likely that the phraseology can be much improved.

To this time it has been reported that the State Association and in some instances the State Board of the states of Colorado, Massachusetts, Ohio, Pennsylvania, South Carolina and Washington have given thorough consideration to the new provisions as presented in concrete form. In addition they have been

thoroughly considered by representatives in the conference from California, Connecticut, Illinois, Michigan, North Carolina, North Dakota, and have found some consideration by the Missouri State Association. The representative from California does not approve Provisions 1 and 2, but in general approves all of the other provisions. The Colorado State Association and State Board approve Provisions 1, 2 and 3 and in part 4 and 5. They disapprove of 6 and 7 because opposed to Reciprocal Registration, and withhold action on Provision 8. The Connecticut Board of Pharmacy in general approves all of the provisions. The Massachusetts Association approves all of the provisions except No. 5, believing that Provision No. 5 would force the prerequisite, which does not seem to be favored. The Michigan State Board and State Association representatives favor all of the eight provisions, but doubt the possibility of securing the first three as a law. The Illinois and North Carolina Association representatives approve all of the eight provisions in the strongest terms. The North Dakota Representatives approve all the provisions, expressing the opinion, however, that some change should be made to provide Reciprocal Registration for those who were registered as pharmacists before the college prerequisite was adopted. The Missouri State Association approves the provisions in a general way, but indicates that they think well of their present law. The Ohio State Association approves the principles of the eight provisions, with a clear understanding and marked satisfaction. The Pennsylvania State Association and Board approve the first seven provisions, but disapprove the eighth provision, believing that all laws pertaining to pharmacy should be enforced only under the supervision of officials connected with pharmacy. The South Carolina Association unanimously approved all of the eight provisions. The Washington Association and apparently its Board of Pharmacy approved the first seven provisions, excepting that in Provision No. 5 they favor a course of study of 1800 hours instead of 1200 hours. No action was taken with reference to Provision No. 8, because it was believed doubtful that a change might be secured in the Washington law where the enforcement now rests with the Department of Agriculture. Comments were also received from Dr. James H. Beal, which are of a general nature, but whose further help in the work of the Conference will be of great advantage.

Your chairman would now recommend:

1st.—That the new provisions submitted find consideration at this time.

2nd.—That the Voluntary Conference be continued under the auspices of the Section on Education and Legislation, until the work is finally completed with the presentation of a draft of Modern Laws Pertaining to Pharmacy.

3rd.—That an appropriation of \$100.00 be allowed the Section for the coming year to continue this work.

4th.—That with such changes as may be decided upon, the eight new provisions be referred back to the Voluntary Conference under the chairmanship of the chairman of the Section on Education and Legislation elected for the new year.

5th.—That with such changes as may be decided upon, the provisions be submitted to the National Association of Retail Druggists, the Conference of Pharmaceutical Faculties, the National Association of Boards of Pharmacy, and to other National Associations which are concerned with pharmacy. Also to the American Medical Association and to all of the State Medical Associations, their particular attention being directed to the first three and to the eighth provisions. That in submitting the provisions for such consideration they be accompanied with a request for an expression of opinion concerning such as may be of special interest.

In conclusion attention is directed to the fact that nearly all, if not all, of the provisions herewith submitted for further consideration, in some manner affect special interests. It is understood or rather must be taken for granted, that there will be opposition to the provisions even if generally approved by retail

pharmacists and by the legitimate members of the medical profession. In one form or another such opposition has already been evidenced. It must be in mind, too, that such opposition may not always be in the open, for at times special interests can best attain their purpose by keeping themselves in the background. In this entire work the aim must be primarily the public welfare and its needs. Selfish aims, whether on the part of retail pharmacists or some of the other branches of pharmacy, or those engaged in medicine, are unworthy of the work which has been undertaken.

#### VOLUNTARY CONFERENCE FOR DRAFTING MODERN LAWS PERTAINING TO PHARMACY.

Under the Auspices of the Section on Education and Legislation of American Pharmaceutical Association. Frank H. Freericks, Chairman; R. A. Kuever, Secretary; W. S. Richardson, George B. Topping and Zada M. Cooper, Associates.

Conference members appointed by Presidents of State Associations and Boards of Pharmacy.

*Representing State Associations:*—Alabama, L. L. Scarborough; Arizona, Thomas E. Thorpe; Arkansas, A. L. Morgan; California, D. R. Rees; Colorado, A. W. Clark; Connecticut, S. M. Aller; Delaware, Albert Dougherty; District of Columbia, W. S. Richardson; Florida, W. D. Jones; Georgia, Herman Shuptrine; Idaho, Rosco W. Smith; Illinois, Prof. C. M. Snow; Indiana, A. F. Sala; Iowa, George D. Newcombe; Kansas, C. C. Reed; Kentucky, Robert J. Frick; Louisiana, Joseph W. Peyton; Maryland, James E. Hancock; Massachusetts, Ernest O. Engstrom; Michigan, John H. Webster; Minnesota, Charles H. Huhn; Mississippi, A. S. Coody; Missouri, Prof. Francis Hemm; Montana, J. A. Riedel; Nebraska, Charles R. Sherman; Nevada, H. J. Duncan; New Hampshire, Edwin C. Bean; New Jersey, George M. Beringer; New Mexico, G. S. Moore; New York, Dr. William C. Anderson; North Carolina, L. W. McKesson; North Dakota, W. S. Parker; Ohio, Waldo M. Bowman; Oklahoma, A. W. Woodmancy; Pennsylvania, S. C. Henry; Rhode Island, James O'Hare; South Carolina, F. M. Ellerbe; South Dakota, D. F. Jones; Tennessee, Edw. V. Sheely; Texas, Sam P. Harbin; Utah, James L. Franken; Vermont, W. R. Warner; Virginia, Walter G. Williams; Washington, Prof. Charles W. Johnson; West Virginia, Walter E. Dittmeyer; Wisconsin, Prof. Edw. Kremers.

*Representing State Boards of Pharmacy:*—Alabama, W. E. Bingham; Arizona, T. L. McCutchen; Arkansas, Frank Schachleiter; Colorado, Frank E. Mortensen; Connecticut, John A. Leverty; Delaware, Reuben M. Kaufman; Georgia, Charles D. Jordan; Idaho, T. M. Starrh; Illinois, Frederic T. Provost; Indiana, Jerome J. Keene; Iowa, David E. Hadden; Kansas, W. S. Henrion; Kentucky, Addison Dimmitt; Louisiana, E. H. Walsdorf; Maine, Frank T. Crane; Maryland, J. Fuller Frames; Massachusetts, Albert J. Brunelle; Michigan, Leonard A. Seltzer; Minnesota, R. L. Morland; Mississippi, T. O. Slaughter; Missouri, Charles Gietner; Montana, W. R. Montgomery; Nevada, Robert L. Prouty; New Hampshire, Herbert E. Rice; New Jersey, Lewis W. Brown; New Mexico, B. G. Dyne; New York, Warren L. Bradt; North Carolina, W. W. Horne; North Dakota, H. L. Haussamen; Ohio, Edward Voss, Jr.; Oklahoma, J. C. Burton; Oregon, J. Lee Brown; Pennsylvania, Lucius L. Walton; Rhode Island, Howard A. Pearce; South Carolina, H. E. Heinitsh; South Dakota, F. W. Halbkat; Tennessee, O. J. Nance; Texas, W. H. Cousins; Utah, John Culley; Vermont, Wilfred Root; Virginia, W. L. Lyle; Washington, D. B. Garrison; West Virginia, Alfred Walker; Wisconsin, Edward Williams; Wyoming, C. B. Gunnell.

#### PROVISIONS FOR THE DRAFT OF MODERN PHARMACY LAW UNDER CONSIDERATION BY THE VOLUNTARY CONFERENCE FOR DRAFTING SUCH A LAW.

It will please be understood that such of the provisions as may find general approval are intended to be embodied in a complete draft of laws pertaining to pharmacy, which shall include all of the desirable provisions which are found at present in the best and most complete pharmacy laws of the several states. It of course is in mind that some provisions of a Modern Pharmacy Law, particularly the provision with reference to the College

Prerequisite Law, will not be deemed desirable in all of the states, and it is understood that features which are not adapted for some of the states can be discarded by such states when they would consider the draft of a Modern Pharmacy Law as a basis for adoption or changes. It will please also be understood that some of the separate provisions as herein submitted for consideration are entirely independent of each other, and that only such provisions should be considered together as by their text show that this must be intended. Finally, it will also please be in mind that it will not be the aim to discard any more exacting requirement which may be found in some of the present pharmacy laws, but to the contrary it will be the aim to have any of the provisions herein which may be found to be desirable, fit in with such possibly more exacting requirements as now may exist. In considering what should be contained in a Modern Pharmacy Law it is submitted that we should be controlled only by the public need and welfare and by the need of correct pharmacy within reasonable limits. The thought that desirable features may be strongly opposed by special interests should not hinder us from promulgating such desirable and necessary features. Let us first decide upon what within reason is desirable and necessary, and thereafter decide upon ways and means for best securing enactment into law. We may find determination and strength in the fact that whatever public welfare requires and fairness demands will ultimately be accomplished.

*Provision No. 1.*—All chemicals and drugs, the maximum adult dose of which according to standard authorities on medicine or materia medica is one drachm or less either fluid or solid, as also compounds and preparations containing such chemicals and drugs, and inclusive specially of Morphine, Opium, Heroin, Chloroform, Alcohol, Cannabis Indica, Hydrated Chloral and Acetanilide, or any derivatives or preparations of said substances, are hereby defined to be of potent character: Provided, that drugs herein not specially named, the maximum adult dose of which is greater than one (1) drachm, but containing active principles of lesser maximum adult dose, as well as compounds and preparations of such drugs, shall be construed to be of potent character only when they contain the isolated active principle as such, and not as a constituent of the original drug.

*NOTE.*—If there are to be legal restrictions over those who would sell so-called patent and proprietary medicines it is essential that some legal ground be found upon which such restriction can be constitutionally based. If the right of sale and distribution is to be limited to qualified people, the means must be provided for bringing into use the special knowledge of such qualified people, and this can be done only by ready information about the contents of active drugs. At the same time it is all-important to avoid unfairness and the destruction of property rights by requiring publication of complete formula. It was therefore decided to submit a definition for potent drugs, as supplemented by the further requirement to show on the label the actual contents of potent drugs, which gives opportunity for the application of special knowledge pertaining to their use as remedies.

*Provision No. 2.*—All chemicals, drugs, their compounds and preparations, of potent character as herein defined, when intended for use as medicines, shall be dispensed, distributed or sold only in containers bearing a label for ready inspection, upon which such potent drug content is plainly shown, as also the percentage of such drugs contained therein: Provided, that when such chemicals and drugs are dispensed in keeping with a written record as made by a licensed physician, dentist or veterinarian, and such written record is retained or filed by the pharmacist, physician, dentist or veterinarian, the label requirement herein shall be satisfied when the container of the chemicals and drugs so dispensed contains a number or mark, corresponding with a number or mark on the written record, so that it may be readily identified.

*NOTE.*—The aim of this provision is to require all packages of medicines to show their contents of potent drugs, no matter by whom prepared or distributed at retail. An exception is made with reference to medicines supplied by or on the order of a physician, dentist or veterinarian. In every such case, however, whether the medicine is dispensed by a physician or by a pharmacist, a record must be made, either on a prescription blank or in a record book, to show the potent drugs which have been dispensed, and the container is then to be identified by a number corresponding with a number on the prescription or other written record. It will be noted that this plan contemplates no distinction between so-called patent medicines and medicines supplied by or on the order of physicians, it being deemed alike important and a public need that it can always be determined what potent drugs a patient may be taking, or may have taken.

*Provision No. 3.*—All chemicals, drugs, their compounds and preparations, when of potent character as herein defined, when intended as medicines, except as hereinafter provided, shall be dispensed and sold at retail to the consumer only by or under the supervision of a registered pharmacist; compounds and preparations of such chemicals and drugs shall be compounded and prepared only by or under the supervision of a registered pharmacist. All such chemicals, drugs, their compounds and preparations, when intended for distribution or sale at retail as medicines in their original packages, shall be labeled to show that they have been prepared by or under the supervision of a registered pharmacist. When imported into this state for sale at retail, they shall in like manner show that they have been prepared by or under the supervision of a pharmacist licensed or registered at the place where compounded or prepared. Such chemicals, drugs, their compounds and preparations, when compounded, prepared and labeled in their original packages as herein required may be dispensed or may be dispensed from and sold by registered physicians, dentists and veterinarians without showing on the label by whom compounded or prepared: Provided, also, that such chemicals, drugs, their compounds or preparations, when compounded, manufactured or prepared by or under the supervision of a registered pharmacist, may be sold or dispensed at retail in communities or places located at least — miles distant from a registered pharmacy, by storekeepers licensed for that purpose by the Board of Pharmacy.

*NOTE.*—Under this provision it is the principal requirement that all medicines containing potent drugs must be compounded by or under the supervision of a registered pharmacist. This applies alike to so-called patent and proprietary medicines, as also to all medicines dispensed by physicians. It would require every patent and proprietary manufacturer and manufacturer of pharmaceuticals to have at least one registered pharmacist in charge. It would not interfere with the dispensing of medicines by doctors, but would require that the medicines which they dispense are prepared under the supervision of a registered pharmacist, and would prevent them from compounding their own medicines unless they are also registered pharmacists. It would restrict the sale at retail of all medicines containing potent drugs, other than those dispensed by physicians to their patients, exclusively to registered pharmacists, excepting in communities where there are no registered pharmacists within a certain distance, and at such places storekeepers duly licensed by the Board of Pharmacy would be permitted to sell such medicines when compounded under the supervision of a registered pharmacist.

*Provision No. 4.*—The State Board of Pharmacy shall consist of five members to be nominated by the State Pharmaceutical Association, and to be appointed by the Governor, etc., at least three (3) of whom shall be graduates of a reputable College of Pharmacy, and all of whom shall be actively engaged in retail pharmacy, having had at least ten (10) years of practical experience therein, the requirement for college graduation not to be applicable to those who at present are members of the existing State Board of Pharmacy.

*Provision No. 5.*—Colleges, Departments and Schools of Pharmacy, to be recognized as such by the State Board of Pharmacy, shall require for graduation a course of study of at least two (2) years, such two year course to be divided by an interim of at least two months, and to provide for at least twelve hundred (1,200) hours of study. They shall have a Chair in Pharmacy, Chemistry and Materia Medica, each in charge of a professor having besides the necessary special learning and training either an academic or scientific degree, or both, from some reputable institution of learning: Provided, that nothing contained in this Section shall apply to those who when this Act becomes effective are or have been teaching in Colleges, Departments or Schools of Pharmacy.

*Provision No. 6.* The State Board of Pharmacy may in its discretion grant Certificates of Registration to persons who furnish proof that they have been registered by examination in some other state, and that they are of good moral character, provided, that such other state in its examination requires the same general degree of fitness as is required by examination in this state, and that the applicant qualifies in all other respects as is required for registration by examination within this state, and provided also, that such other state or states in like manner grant reciprocal registration to pharmacists and assistant pharmacists of this state. Applicants to the State Board of Pharmacy for Reciprocal Registra-

tion shall defray all necessary expense for making an investigation into their character and general reputation, as well as pharmaceutical standing in the state where they formerly resided, such expense of investigation not to exceed the sum of ten (10) dollars, and for the purpose of such investigation and report thereon, the State Board of Pharmacy may secure the service of individuals or associations who are engaged in the work of compiling such information, at an expense not to exceed ten (10) dollars in each separate case. In addition, an application for Reciprocal Registration shall be accompanied by an original registration fee of \$10.00, which shall be refunded in case registration is not granted.

**NOTE.**—It is the aim of this provision to allow a Pharmacist registered by examination in a state not having the College prerequisite, to become registered in another state which has such College prerequisite, if the applicant can prove that in addition to his registration by examination he also is a graduate of a recognized College. This provision also looks to placing the activities of the National Association of Boards of Pharmacy on a legal basis within each state by permitting that the information which said Association is prepared to furnish regarding an applicant for reciprocal registration, may be secured by the different State Boards at an expense not to exceed \$10.00, which must be paid by the applicant for reciprocal registration.

*Provision No. 7.*—In order that the State Board of Pharmacy may be informed, and properly determine the status of the Boards of Pharmacy of other states desiring Reciprocal Registration, and that it may be generally advised regarding progress in pharmacy throughout the country, the said Board shall annually select one of its members, who shall meet with like representatives of such other State Boards of Pharmacy, as may be arranged, for the purpose of discussing and determining the degree of fitness required by such Boards, and the general advancement as made in Pharmacy. The expense of such representative shall be paid and allowed as are all other lawful expenditures of the members of the Board of Pharmacy. At meetings arranged for between the representatives of this State Board of Pharmacy with the representatives of other State Boards of Pharmacy desiring reciprocal registration there may be adopted uniform regulations and requirements which are deemed desirable by each of said representatives for their respective states to govern reciprocal registration, but such rules and regulations shall not be construed as based upon agreement by an official of this state with officials of other states, and they shall be binding only if adopted by the State Board of Pharmacy as its own rules and regulations, and then only to govern within this state as the result of independent decision on the part of the State Board of Pharmacy, without any agreement by or with other State Boards of Pharmacy. The representative of the State Board of Pharmacy as such shall not enter into or join in the formation of any association depending upon agreement between the officials of this state with the officials of other states, but this shall not be construed to prevent such representative in his individual capacity from joining or being a member of an association which may be constituted of the representatives of State Boards of Pharmacy, also acting in their individual capacity. Any association so existing which is engaged in the compilation and study of the work of State Boards of Pharmacy, and which has for its object the general advancement of pharmacy and the keeping of records pertaining to the reciprocal registration of pharmacists, may at the discretion of the State Board of Pharmacy be given such information as it possesses pertaining to such aims and objects. The State Board of Pharmacy at an expense not to exceed one hundred (\$100) dollars annually may subscribe for and secure the services of an association engaged in the compilation of pharmaceutical information and progress specially adapted for securing the greatest efficiency in the work of said Board.

**NOTE.**—This provision aims first of all to specifically legalize the expense of representatives of Boards of Pharmacy in meeting with representatives of other Boards of Pharmacy. It avoids agreement between officials of the several states which might be unconstitutional, and yet allows representatives of State Boards in their individual capacity to belong to an Association which is organized for the purpose of compiling and disseminating information of value to all of the several State Boards of Pharmacy. Finally, it permits the several State Boards of Pharmacy to subscribe for the services of such an Association, thus indirectly defraying the expense of maintaining it. In order to legalize such expenditure, the Association of Boards of Pharmacy is placed on the basis of a Bureau of Information, which renders needed service for an annual consideration, just as a Commercial Agency renders service to Commercial Enterprises, for an annual subscription fee.

*Provision No. 8.*—There shall be established within this state the office of a Drug Commissioner, who shall be selected and appointed at a joint meeting of the State Medical Board and the State Board of Pharmacy by said Boards. He shall hold office for a term of five (5) years, until his successor has been appointed, subject to removal for incompetency or other good cause. Subject to the authority of the State Boards of Medicine and of Pharmacy in joint meeting, it shall be the duty of the Drug Commissioner to enforce the Pure Drug, Poison and Narcotic Laws of this state, and for that purpose he may employ chemists, inspectors and other necessary employees within the appropriations allowed him for the enforcement of said laws. Within thirty (30) days after this Act is in force it shall be the duty of the President of the State Board of Pharmacy to call a joint meeting of the members of the State Medical and Pharmacy Boards, at the capital of the state and at a place to be designated by him, such meeting to be called on a notice of at least ten (10) days. At such joint meeting, it shall be the duty of the members of both said Boards to attend, they shall organize by selecting a President, Vice President and Secretary of said joint boards. The Secretary of either the State Medical Board or the State Board of Pharmacy, as decided at said meeting, shall act as the Secretary for said joint boards, he shall be allowed such extra compensation as may be decided, not to exceed the sum of one hundred (\$100) dollars annually, and it shall be his duty to keep a separate book of the Minutes and Proceedings of said joint boards. Said boards shall meet in joint session at least annually, and at such other times as may be decided at such joint meetings, and also at the call of the President. If membership on said respective boards be of unlike number, the members of the board having the largest number shall collectively have no greater number of votes than there are members of the smaller board. In the absence of agreement in the selection of a Drug Commissioner at joint meetings held for that purpose, such failure to agree shall be certified to the Governor, who thereupon shall make the appointment. It shall be the duty of said boards in joint meeting to adopt rules and regulations to govern them for the purpose of such joint meetings, and to govern the Drug Commissioner in the performance of his duties. At the annual meetings of said boards in joint session after becoming fully informed as to the needs and requirements in that respect, said boards in joint meeting shall decide upon the annual appropriation to be paid out of the funds of the state necessary for conducting the office of the Drug Commissioner, and shall submit the needs for such annual appropriations to the proper committee or committees of the General Assembly for suitable action by it.

*NOTE.*—The enforcement of Drug, Poison and Narcotic Laws should be under the control and supervision of those who have special knowledge pertaining to them and their correct use. In nearly all of the states this important need is ignored. Physicians and pharmacists are equally and primarily interested, and in many respects such laws must govern them alike. It therefore has been deemed advisable by some, that the supervision and enforcement of such laws should be under the control of the recognized Medical and Pharmaceutical Authorities. The thought has been expressed also that by thus bringing together the State Authorities concerned respectively with medicine and with pharmacy, there will be greater opportunity for mutual understanding and more friendly relationship between the two professions.

Now, the Chair would like to state that it would be within your province to adopt the recommendations that appear in this report, other than those that have become impossible of adoption because of existing conditions, and a motion of that kind, to that effect, would be entertained.

Moved by Mr. Nitardy and seconded by Mr. Godding that the recommendations numbers 2, 3, 4 and 5 contained in the report of the Voluntary Conference for Drafting a Modern Pharmacy Law be adopted and that the report be referred for publication.

The motion having been regularly made and duly seconded, and the question put, the motion was declared carried.

Chairman Freericks: I wanted to report on the provisions of a Modern Pharmacy Law, but this will have to go over until next year. The last thing

on the program will be the election of officers. I understand this has to be by ballot. At the last session the nominations were closed for that session and further nominations are in order for all of the offices.

Dr. Anderson: I move that the nominations be closed finally and that the Acting Secretary be instructed to cast the ballot for the Section for the election of the officers nominated.

Seconded by Mr. Nitardy.

The motion having been regularly made and duly seconded, and the question put, the same was declared carried.

The Acting Secretary then cast the unanimous ballot of the Section for, Chairman, Frank H. Freericks; Associates, Louis Emanuel, Zada M. Cooper, and C. H. Packard, and for Secretary, R. H. Kuever.

There being no further business before the Section, a motion was made to adjourn, and the same having been duly seconded and the question voted, the Section thereupon adjourned sine die.

---

#### BACK-FIRING.

To many who have read the much over-written case of the Chicago infant who recently came into and went out of this world with certain deformities, the question doubtless occurred: What would the followers of Mrs. Eddy do in such a case? Logically the followers of this cult would have done just what happens to have been done by the physician in charge: Nothing. And the result, of course, would have been the same. Possibly because this line of thought is rather obvious, the *Christian Science Monitor* devotes over a column to the case. Under the sonorous title "*Ave Medicus Imperator*," this journalistic champion of Mrs. Eddy's doctrines belabors the medical profession, charging that "the place of Caesar as a dispenser of life and death is to be taken by the modern physician," and, further, that "the hospital is to usurp the position of the arena." The article, of course, is wholly in the nature of a back-fire. The poor human mite, whose short but tragic life and equally tragic death have proved such a boon to the sensational newspapers and such a grief to the thoughtful, really "passed over" strictly according to the tenets of Mrs. Eddy's disciples. We assume, naturally, that even the most rabid of that sect would hardly claim that thought-waves, either long or short range, would remedy a congenital deformity. The baby died because "treatment" was "absent."—*Journal A. M. A.*

Papers Presented at the Sixty-Third Annual Convention

### PRINCIPLES UNDERLYING THE USE OF VACCINES, BACTERINS, ANTITOXINS AND IMMUNE SERUMS AS AGENTS FOR THE PREVENTION AND CURE OF INFECTIOUS DISEASES.\*

F. E. STEWART, PH. G., M. D., PHAR. D.

This is the first of a series of papers. The second will deal with Diagnostic Reagents and their uses in the diagnosis of infectious diseases. The third will consider the application of biologic products as therapeutic agents.—[EDITOR].

Infectious diseases are caused by the growth and multiplication in the body of bacteria, protozoa, moulds and yeasts. They are combats between lower and higher forms of life according to the general law of struggle for existence constantly going on between all forms of living matter. Closer analysis shows that the battle is between the protoplasm of the conflicting forces, with enzymes as weapons of offense and defense.

Groups of symptoms and phenomena caused by the growth and multiplication of these living organisms and representing the external or visible evidences of their growth and multiplication in the body have, in the past, been considered as diseases, in themselves. These phenomena may be compared to the noise and smoke of battle; the real conflict being between the microbial cells and the body cells. In the prevention and treatment of infectious diseases, we aim our weapons at the combatants, not at the noise and smoke.

The phenomena of recovery from infectious diseases have been investigated and as a result we have a new therapeutics in which modified infective agents and products resulting from artificially immunizing animals are used in treatment.

*Bacteria.* These one-celled microorganisms, now so well known to bacteriologists, are classed by some authors with the vegetables, others class them with the animals. However, their classification is more of an academic question than one of practical importance. The bacterial cell may be berry-shaped, rod-shaped, or spiral, giving rise to the names coccus (pl. cocci), bacillus (pl. bacilli), and spirillum (pl. spirilla), respectively. The cocci may grow in pairs (diplococci), in bunches like grapes (staphylococci), in chains (streptococci), etc. And their

cultures may be colored giving such names as aureus, citreus, albus, etc. Their size, rapidity of growth, method of reproduction, sporulation, etc., are important subjects in relation to their method of growth and multiplication in the body as infective agents, but the limits of this paper will not permit detailed discussion and the reader is, therefore, referred to works on bacteriology.

*Protozoa.* The protozoa are essentially unicellular (one-celled) animals. The individual or "person" in this grade of the animal kingdom is a single cell; and, although we find protozoa which consist of aggregates of cells, yet an examination of the details of their structure and life history establishes the fact that the cohesion of the cells in these aggregates is not an essential feature of the life of the individual protozoon but a secondary and non-essential arrangement.

*Yeasts and Moulds.* The yeasts or blastomycetes and the moulds or hyphomycetes are closely related organisms, distinguished from each other and from the bacteria by morphological characteristics and methods of growth. The limits of this paper will not permit a detailed description. The vital properties or "functions" of living protoplasm in so far as this study is concerned, are best exhibited by the living protoplasm of the amebae.<sup>2</sup>

*The Ameba.* The ameba is a protozoan having a simple protoplasmic body with a nucleus and nucleolus and granules. The constant flowing out or extension of an ameba or other mass of protoplasm into irregular processes, called pseudopodia and their subsequent retraction or effacement, is termed *ameboid movement*. In the higher plants and animals the movements of the protoplasm are combined and directed so as to produce effects in relation to the whole organism built up of countless cells. The white corpuscles or leucocytes appear to be masses of free formative protoplasm, having the power of locomotion (ameboid movements) and capable of assuming various shapes.

Under the microscope a pseudopodium is observed to extend and into it the granules stream in constant current until the whole protoplasmic body has changed its location and form. These movements, ameboid movements and granule streaming as manifested by the protozoa, are intimately related to the processes of hunting, seizing, and ingesting food, and of the intercourse of the individuals of a species with one another and their evasion of hostile agencies. The same applies to the movement of cilia and flagella, which subserve the needs of the individual cell of which the moving protoplasm is the main substance.

*Plants, Animals and Man. In a Sense Colonies of Amebae.* Plants and animals (including man), while made up of special organs and tissues and cells, yet consist of cell-units which manifest vital phenomena or functions inherent in the protoplasm itself, namely, contractility, irritability and automatism, reception and assimilation of food, metabolism with secretion and excretion, respiration and reproduction, phenomena we accordingly recognize as muscular or nervous, secretory or excretory, respiratory, reproductive and the like.

Yet in these organs and their tissue cells, however specialized to one function only, a residue of all or nearly all the other fundamental properties of protoplasm

<sup>2</sup>The ameba and the foraminifera afford convenient and classical examples of the protoplasm of the lowest animal forms; the white corpuscles of the blood, or leucocytes should also be examined. Vegetable examples are readily obtained from the cells of a growing shoot; while the living cells of *chara*, a genus of cryptogams, and other examples of protoplasmic movement, should be observed.

remains and may be developed; and thus those changes which we call "adaptation to environment," and those pathological disturbances we term "disease" are alike provided for.

We thus find the vital functions of protoplasm taking part in the warfare between infective organisms and body cells.

The intracellular digestion of food by these lower forms of life has been contrasted with the "cavitary" or entral digestion of higher animals, that is, the digestion that goes on in the alimentary canal. In the latter, enzyme and acid (or alkalies) are poured out by the cells of the secreting organs and glands into the digestive canal, and digestion is extra-cellular.

The digestive organs and tissues of the higher animals are specialized. The digestive glands of the mouth produce ptyalin, a starch digester; the gastric glands produce pepsin, a protein digester; the pancreas furnish a digestive "juice" containing three enzymes, trypsin, amylase, and steapsin, which respectively digest proteins and starch, and split up fats.

The enzymes produced by the protoplasm of bacteria and protozoa are not the products of specialized organs and tissues as is the case with the higher forms of animals, but they are capable of digesting the proteins and carbohydrates which constitute their food. In the same manner the cells of the body are able to digest substances with which they are brought in contact.

The digestion carried on by the body cells not directly related to the alimentary canal and its secretory organs is known as *parenteral* digestion. For example, when protein, living or dead, is introduced into the tissues of an animal or man, the body-cells are stimulated to produce a specific proteolytic enzyme or digestive ferment which digests and destroys it.

*What Is Meant by Pathogenicity.* The protoplasm of the infective agent, having become a parasite, lives at the expense of the tissues of the host. As stated by Vaughan, the pathogenicity of a bacterium, or its power of producing disease, is dependent upon its ability to grow and multiply in the body tissues. Any microorganism which can grow and multiply in an animal body is pathogenic to that animal. To grow and multiply in the animal body, the invader must convert the proteins of the animal into its own proteins. A foreign protoplasm (bacteria, protozoa, etc.), can grow and multiply in the human body only if the invader is capable of digesting and utilizing the proteins of the body. All living cells grow by means of their own digestive ferments, and these must act upon the pabulum within their reach. If the ferment of the bacterial cell cannot digest and prepare food for the bacterium from the body protein (protoplasm) then the invading bacterial cell dies. If the digestive ferment produced by the body cells is rapidly and thoroughly destructive there is no bacterial development and the organism is innocuous.

*Structure of the Protein Molecule.* Protoplasm is composed chiefly of protein. According to Vaughan and his co-workers, all true proteins are constructed upon the same general plan, and consist of a central group, keystone or archon, around which are arranged sub-groups. The central group is common alike to all proteins. It is a poison, but not a toxin, that is, it is incapable of stimulating the body cells to produce an antitoxin when introduced into the animal body. Its poisonous properties are due to its powerful affinity for the secondary groups

of other proteins. The secondary group or groups of each protein molecule is specific. The power of the protein to stimulate the body cells to produce a specific proteolytic enzyme resides in the secondary groups.

*Typhoid Fever as an Illustration of Infection and Subsequent Immunity*<sup>3</sup>. The infective agent of typhoid fever is the typhoid bacillus. It is infective because by means of its digestive ferment it can feed on the proteins of man's body. This means that it can convert man's proteins into typhoid proteins and thus multiply its kind. Moreover, it is not, immediately on its entrance in man's body, destroyed by the ferments of the body cells. Having found admission to the body it proceeds to grow and multiply. This continues through the period of incubation, which in this disease is somewhere about ten days. During this period of incubation there is no effective resistance on the part of the body cells to the growth and multiplication of the foreign protein. During this time the man is not sick, and we conclude therefore that it is not the growth of the foreign protein which *per se* gives rise to the symptoms of typhoid fever. However, during this time the body cells are being prepared for their combat with the foreign protein. This preparation consists of the development in certain of the body cells of a new function, that of elaborating a new and specific ferment which will digest and destroy the foreign protein. When this new ferment begins its action the first symptoms of the disease appear. The active stage of the disease, with its symptoms and the lesions induced, marks the period over which the parenteral digestion of the foreign protein exists. Death may come from the too rapid breaking up of the foreign protein and the consequent liberation of a fatal dose of the protein poison, which is always formed on the disruption of the protein molecule, or it may result from some lesion induced by the products of this disruption, such as perforation and hemorrhage, or it may follow from chronic intoxication and consequent exhaustion. In case of recovery the individual is, for a time at least, immune to the typhoid bacillus because his body cells are now able to elaborate and make immediately effective the specific ferment which destroys the typhoid protein.

To this stimulating action of the secondary group of the protein molecule upon the body cells which causes the development in the body of the man a specific proteolytic enzyme, Vaughan has given the name "protein sensitization." "There is developed in certain body cells a new function, that of elaborating this new ferment."

*Phagocytosis*. Metchnikoff has demonstrated that those body cells, known as leucocytes, and commonly called white corpuscles of the blood, possess the power of digesting and disposing of foreign proteins when introduced into the animal body. The leucocytes are little masses of free protoplasm, similar to the ameba and capable of ameboid movement. The leucocyte, like the ameba, in feeding, projects a pseudopodium outward until it comes in contact with the food particle, which it now proceeds to engulf, and by means of its enzymes, digest. Metchnikoff teaches that the leucocytes have the power of destroying bacteria invading the body, and on that account gave to these organisms the name "phagocytes," or "cell eaters" (from *phagēin*, to eat and *kutos*, cell). It is now generally conceded

<sup>3</sup>This illustration is taken from Vaughan's book entitled "Protein Split Products in Relation to Immunity and Disease."

that the tissue cells, as well as the leucocytes, possess the power of phagocytosis. They have, therefore, been fancifully described as "sessile phagocytes."

According to Metchnikoff, the digestive power of the phagocytes is exerted through the agency of enzymes or ferments known as "cytases."

#### FUNCTION OF THE BODY FLUIDS IN IMMUNITY.

Bacteria may be destroyed by the digestive action of the body fluids into which the enzymes have been discharged, and which therefore possess the same power of destroying bacteria originally characterizing the phagocytes themselves. Serum from the blood of an immunized animal (immune serum) manifests three main specific actions, namely, (a) bactericidal and lysogenic action; (b) opsonic action; (c) agglutination and the closely allied precipitating action. It is, therefore, assumed that these actions are due to certain antibodies. The bactericidal and lysogenic action is assumed to be due to the presence of *bacteriolysin* (lysis, to dissolve). Some authors believe that the body fluids also contain *bactericidin*, having the power of killing bacteria without dissolving them. The opsonic action is assumed to be due to *opsonins*. When a small quantity of immune serum is added to a suspension of the corresponding bacterium, the organism becomes agglutinated into clumps and motility is suspended or destroyed. This action is assumed to be due to the presence of *agglutinins*. The immune serum may not only cause agglutination, but when added to the filtrate of a culture of the corresponding bacterium, may produce a cloudiness and afterwards a precipitate. The name *precipitins* has been given to these hypothetical substances.

*Antigens and Antibodies.* In overcoming the infective agent the body cells of the animal undergoing the immunizing process develops certain protective substances above referred to. Possessed of these protective substances, the animal can subsequently withstand a more severe attack of the same infection and is, therefore, said to be immune. These protective substances are classed under the general head of antibodies, and the substances used for immunization are called *antigens*.

Practically any protein substance may serve as an antigen. Its injection gives rise to specific proteolytic, or digestive ferments, as we have already seen. According to Vaughan, all enzymes are composed of *complement* and *amboceptor*. The specific part of enzyme is the amboceptor. Each kind of protein when introduced into the animal body stimulates the body cells to produce specific amboceptor, the function of which is to prepare the protein for the lytic action of the complement. As already stated, the complement is not specific. It is not increased by the immunizing process. It is practically the same no matter from what animal obtained. It will cause the lysis of any kind of protein, provided the latter is first prepared for lysis by union with its appropriate specific amboceptor. For instance, if egg albumin is used as an antigen, the body cells are stimulated to produce specific proteolytic amboceptor capable of *sensitizing* egg albumin. The same applies to serum albumins and globulins, milk, epithelial cells, vegetable albumin, etc. It also applies to bacteria. Each kind of bacteria requires a specific amboceptor for its digestion. This amboceptor must be produced by the body cells and unite with the antigen (bacterium) before the complement can act upon it and cause *bacteriolysis*.

*Stimulins, Opsonins and Bacteriotropins.* It has long been taught by Metchnikoff and others that there are certain substances in the body fluids which aid phagocytosis. Metchnikoff regarded them as *stimulins*, or substances that stimulate leucocytes to become more actively phagocytic. On the other hand, Wright, Douglas, Hektoen and others have demonstrated that these substances aid phagocytosis, not by stimulating the leucocytes, but by preparing the bacteria for ingestion and digestion by them. Wright gave the name opsonins to these substances (from the Greek word *posono*, "to prepare food for."). They are also known as *bacteriotropins*. The source of opsonin is unknown. Thermostable opsonin (opsonin not affected by low heat, 56-58° C.) is increased by artificial immunization and by disease. It is largely of the nature of amboceptor, which is also thermostable, and increased by the immunizing process. It is, like amboceptor, specific, and is probably produced by the body cells, especially by the local cells at the site of infection. Thermolabile opsonin—largely occurring in normal serum—is, like complement, non-specific, and is not increased by the process of immunization. Complement is also thermolabile.

#### ACTIVE IMMUNIZATION.

The process of stimulating the body cells to produce antibodies (enzymes) is called *active immunization*. The immunity following disease is an example, but the term is usually applied to artificial immunization.

*Vaccination.* A vaccine is an infective agent so modified as to prevent its growing and multiplying in the body, but not so changed as to destroy its power as an antigen. When a vaccine is introduced into the body in small doses the body cells react, producing antibodies (enzymes), and a resulting immunity against the corresponding infectious disease, without marked disturbance to the system or danger to life.

*Smallpox Vaccine.* This is an attenuated living virus consisting of the infective agent of smallpox modified by passage through the cow. The virus in its passage through the cow becomes so modified that it can no longer produce smallpox, but is still able to stimulate the production of the specific antibodies (ferment, or specific amboceptor) against this disease. Centuries before the Christian era the Chinese observed the immunity against a second attack enjoyed by those who had survived smallpox. By inoculation, i. e., artificial transfer of the smallpox virus, they endeavored to check the spread of the disease. The people of eastern countries were also accustomed to expose their children to a mild case of smallpox in order that a similar mild attack might produce immunity against the disease. These practices, however, were not without risk, as this mild disease not infrequently became a virulent one, and it was also found that the disease so produced could be spread as readily as the natural form. It was long known that milkmaids who contracted smallpox from sores on the udder of the cow were immune against smallpox. Edward Jenner in 1796 demonstrated experimentally that when the virus of cowpox is applied to the abraded skin of a human being a trivial affection, since called "vaccinia," results and that this is followed by complete or almost complete immunity to smallpox for a long period of years. Re-vaccination should be practiced after five to seven years to insure a more potent and lasting immunity.

*Rabies Vaccine.* The work of Jenner was purely empirical. Pasteur laid the foundation of scientific immunology in 1858, 1860, 1863. It was not until 1879 that he made the discovery that light, high and low temperature, and exposure, could so reduce the virulence of an infective agent that while its injection into an animal was practically without danger or ill effect, it could stimulate the mechanism of immunity in the host and produce a lasting protection against infection.

This fact was accidentally discovered by Pasteur when working on chicken cholera. He found on returning from an absence from his laboratory that the cultures of the chicken cholera organism with which he had been experimenting had become innocuous. The far reaching importance of this fact at once impressed him and resulted in his demonstration that a mild form of chicken cholera may be produced by using as antigen an attenuated organism, and that this mild attack would confer immunity against the severe form of the disease. On this discovery is based modern bacterin and serum therapy.

Shortly after this epoch-making discovery Pasteur (1880) startled the world by announcing that rabies resulting from mad dog bite could be prevented by vaccination. The process consists of active immunization with emulsion of the spinal cord of rabid animals (rabbits) reduced in virulence by drying for a certain length of time over caustic potash. The incubation period in rabies is comparatively long, varying from three weeks to perhaps several years, while that of the attenuated virus is relatively short, thus making it possible to administer effective vaccination after the infection of the patient by the bite of the rabid animal.

*Bacterial Vaccines or Bacterins.* These antigens consist of suspensions or so-called emulsions of pathogenic bacteria, modified by heating them to a temperature sufficient to destroy their viability or securing the same results by antiseptics, but not so altering them as to destroy their power of stimulating the body cells of the vaccinated individual to produce antibodies. The suspension is usually made in physiological salt solution, which should be isotonic with the blood, and they are standardized either by bacterial count or by determining the amount of bacterial products in each cubic centimeter by drying and weighing. They are administered by subcutaneous injection or intravenously, and used either for prophylaxis (antityphoid immunization), or for treatment. The blood serum of the individual subjected to a dose of bacterial vaccine manifests increased opsonic power, that is, power to prepare bacteria, of the same kind injected for ingestion and digestion by the phagocytes.

*Sensitized Bacterial Vaccines.* When pathogenic bacteria are treated with immune homologous serum, i. e., serum from the blood of an animal immunized against the same kind of bacteria to be used for preparing the vaccine, their viability is so reduced that they become incapable of reproduction yet still potent as antigens. Such bacteria are described as "sensitized." By this method the specific amboceptors contained in the immune serum are made to combine with the bacteria, thus preparing them for the immediate action of complement when introduced into the body of the person to be immunized. The blood serum of the individual subjected to a dose of sensitized bacterial vaccine manifests increased bacteriolytic power. According to Garbat immunity following the injection of

sensitized bacterial vaccine is largely due to increase in "bacteriolysin" rather than to increase in "opsonin."

*Sensitized Killed Bacterial Cultures.* These products differ from sensitized living bacterial cultures in being absolutely safe in so far as *viability* is concerned. It is believed by some that the use of living sensitized cultures may possibly cause carriers and spread disease. Until this and other important questions are answered in a satisfactory manner the U. S. Government will continue to refuse license for their commercial manufacture.

In explaining the action of sensitized vaccines, Besredka refers to the researches of Garbat and Meyer. These investigators aver that bacteria are typical cells consisting of an external protoplasmic envelope and an internal nuclear portion. When they are disrupted by the action of amboceptor and complement, the outer portion is digested and the inner portion (endotoxin) set free. Both portions are toxic; both give rise to individual immunizing substances by stimulating the tissue cells to produce them. Immunity is, therefore, partly due to the production of endotoxin and partly due to the production of bacteriolysin.

As the explanation of Garbat and Meyer resembles in some particulars the teachings of Vaughan and his associates, I wrote to Professor Vaughan in regard to sensitized vaccines, and asked further information on the subject from his viewpoint. He replied as follows:

UNIVERSITY OF MICHIGAN, ANN ARBOR, NOV. 8, 1915.

*Dear Doctor Stewart:*

It seems to me that the action of sensitized bacteria compared with the unsensitized bacteria is best explained by my theory. Probably it will be best to first state my theory and then see how it applies to sensitized bacteria. A protein sensitizer or anaphylactogen (called by others antigen) is a protein substance which when injected into animals causes certain body cells to produce a specific proteolytic ferment. This specific ferment digests and destroys its homologous sensitizer or the protein which has caused its development. This ferment, like all other ferments, consists of amboceptor and complement. Now let us apply this to sensitized bacteria. Bacteria, typhoid bacteria for instance, are sensitized by submitting them in vitro to immune serum. These bacteria thus are saturated with their specific amboceptors and when such sensitized bacteria are injected into an animal they are already fitted for complete digestion. In the animal the complement acts upon the prepared bacteria and their digestion is complete. So complete is their digestion that a large part of their poisonous constituents is destroyed and the animal is immunized by the nonpoisonous constituent of the sensitized bacteria. For this reason the animal treated with sensitized typhoid bacteria shows little disturbance, while on the other hand, the animal treated with unsensitized bacteria must elaborate both amboceptor and complement. This takes time, the period is longer, the digestion is less complete, more of the poison is set free, less of the poison is destroyed in the process of digestion, and consequently the life of the animal is placed in greater jeopardy. Garbat and Meyer believe that immunization is secured by the poisonous constituent or constituents of the typhoid bacillus. According to my theory, the poisonous constituent of the typhoid bacillus has nothing to do with the production of immunity or sensitization. Sensitization and immunity are induced by the nonpoisonous part of the typhoid bacillus. Subjecting the typhoid bacillus in vitro to immune serums, in other words sensitizing the bacteria in vitro, prepares the bacteria for digestion, and when introduced into the body they are digested speedily and completely, or so nearly completely that a large part of the poisonous part of the bacterial molecule is destroyed. It seems to me that if the article by Garbat and

Meyer is read with my theory in view, it is confirmatory of that theory. It has been shown by Freidberger, myself, and others, that very small amounts of the protein poison produce an elevation in temperature. Large amounts produce a depression in temperature. Sensitizing with immune serum in vitro prepares these bacteria for ready and complete digestion as soon as they are introduced into the animal body. Therefore, there is less disturbance in the animal body when sensitized bacteria are introduced than when unsensitized bacteria are given. This is the way I look at it.

I don't know whether I have made myself clear on this point or not. I know that I have been able to sensitize animals with the nonpoisonous part of typhoid bacteria. This nonpoisonous part which I have obtained has been secured by a crude way. The nonpoisonous part, which is split off by sensitizing bacteria with immune serum, is a much more efficient preparation than mine. The point that I insist upon is that the sensitizing group in the protein molecule, and this of course means the immunizing group, is not the poisonous group, but is found among the nonpoisonous groups. The poisonous group in all proteins is much the same, physiologically the same, chemically there must be fine differences, while the sensitizing group is not the same in any two kinds of proteins; hence its specificity.

I may be cranky on this subject. I think that the nomenclature of Ehrlich has been wrongly applied to sensitization and to bacterial immunity. The protein poison is not a toxin, it is a poison. It produces no antibody.

V. C. VAUGHAN.

#### ADVANTAGES OF SENSITIZED OVER NONSENSITIZED BACTERINS.

The following advantages of sensitized over nonsensitized bacterins are noted:

1. As a rule they produce but slight local reaction (inflammation at site of injection). This rule has its exceptions. Occasionally severe local reactions follow their injection. However, this is not as likely to occur when using the sensitized bacterin as when the nonsensitized are employed.

2. They cause no general reaction. This is the rule, but it has exceptions. General reactions are manifested by malaise, increased temperature, etc.

3. They may be given more frequently and in much larger doses than the unsensitized bacterins (every twenty-four to forty-eight hours). Occasionally persons are found who cannot digest larger doses. In such cases the dose should be decreased.

4. The immunizing effect is almost immediate (manifesting itself within from 24 to 48 hours), instead of 9 to 10 days.

5. The course of treatment for immunizing an individual against typhoid fever used by the U. S. Army is to inject 500,000,000 killed typhoid bacilli subcutaneously, to be followed 10 days later by the injection of the second dose (10 million killed bacteria), and after another interval of 10 days by the injection of the third dose (1000 million killed bacteria). The dosage of sensitized typho-bacterin is twice as large, i. e., 1st dose 1000 million, 2d dose 2000 million, 3d dose 2000 million. Intervals 6 to 7 days. In the event of a threatened epidemic the advantages in favor of a quick acting bacterin immunity against typhoid fever are not difficult to realize.

6. According to Besredka, sensitized bacteria give results in very late stages of the disease, when no response is secured from the ordinary bacterins, and even serum treatment is ineffective.\*

7. Owing to the fact that the specific bacteriolytic amboceptor is already united to the antigen (bacteria), and therefore ready for prompt digestion by the body cells when injected it follows that the body cells are saved from the

\*Bulletin de l'institut Pasteur, viii, 6, pp. 241-253, Mars, 1910.

effort of producing amboceptor, an effort which the body cells of a patient sick with typhoid fever may be unable to accomplish.

8. There is not the same liability of producing what is called a "negative phase"—the temporary condition sometimes following the injection of an ordinary bacterin owing to the using up of the normal opsonin in the patient's blood, the same being required to prepare the injected bacterin for phagocytosis.

#### PASSIVE IMMUNITY-SERUM THERAPY.

So called because the body cells of the individual undergoing immunization have no part in producing it. Active immunity is produced in some other animal, usually the horse, and the individual to be passively immunized acquires immunity by receiving injections of immune serum taken from the immunized animal. The use of diphtheria antitoxin to prevent diphtheria (prophylactic immunization), and as a curative agent in its treatment (curative immunization) illustrates the main purposes for which passive immunization is employed.

Although sufficient evidence has not yet accumulated to permit positive statements, it is believed that more than one antibody is usually present in each immune serum, and that the immunity acquired by their employment is due to several antibodies, which, acting together, tend to overcome infection.

As stated by Kolmer<sup>6</sup>, "From the practical standpoint, therefore, immune serums may be used to produce two main types of passive immunization, namely:

"1. *Antitoxic immunization*, due to antitoxins opposing the true extra-cellular toxins, as in diphtheria and tetanus (antitoxic immunity).

"2. *Antibacterial immunization*, due mainly to bacteriolysins and bacteriotropins (antibacterial immunity)." Serums containing these antibodies are useful in the treatment of infections due to the meningococcus, pneumococcus, streptococcus, gonococcus, etc.

I am forced to end this paper abruptly to permit its publication in the JOURNAL. It is my intent to continue the subject in subsequent papers.

---

## STABILITY OF PREPARATIONS CONTAINING YELLOW PHOSPHORUS.\*

---

H. ENGELHARDT AND O. E. WINTERS.

---

In our previous paper entitled the "Estimation of Yellow Phosphorus"<sup>1</sup> read at the Detroit meeting we announced our intention to substitute other copper salts for copper nitrate, which we used in the process suggested.

The tabulated results of this work show quite plainly that no advantage is gained by the use of other salts of copper over the nitrate.

With the exception of those made with copper chloride, the results obtained when employing other copper salts were fairly uniform. Copper chloride is the least appropriate for this purpose, due to the apparent decomposition of the

<sup>6</sup>A Practical Text-book of Infection, Immunity and Specific Therapy, by John Kolmer, M.D., Dr. P.H., Phila. W. B. Saunders Co., 1915.

\* Read in Scientific Section A, Ph. A., San Francisco meeting.

<sup>1</sup> Journal A. Ph. A., Apr. 1915, p. 451.

copper compounds, especially copper phosphide, which takes place. Again we have found that the direct copper nitrate method as outlined in our previous paper gives trustworthy results. We also found that it is advisable and important to collect the ammonium-magnesium phosphate in a Gooch crucible, because less wash-liquid is required to remove the excess of magnesia mixture and the danger of dissolving the ammonium-magnesium phosphate is consequently practically eliminated.

## APPLICATION OF VARIOUS COPPER SALTS.

2.837 gms. of dried phosphorus was dissolved in 250 cc. of air-free chloroform and 10 cc. of this solution, equal to 0.1135 gms. of phosphorus, was treated with copper nitrate solution directly. The following results were obtained:

.392 gm.	$\text{Mg}_2\text{P}_2\text{O}_7$	=96.45	per cent	of the theoretical amount.
.393 "	"	=96.7	"	"
.400 "	"	=99.51	"	"

The same quantity of the chloroformic phosphorus solution was then treated with copper nitrate solution, the copper phosphide was filtered as outlined in our previous paper and both the nonoxidized phosphorus and the oxidation products were estimated with the following results.

<i>Magnesium pyrophosphate from phosphide</i>	<i>Magnesium pyrophosphate from filtrate</i>
.268 gm.=65.94 per cent phosphorus	.117 gm.=28.78 per cent phosphorus
.255 gm.=62.73 per cent phosphorus	.136 gm.=33.46 per cent phosphorus
	or combined 94.72 per cent
	96.19 per cent

The 10 per cent copper nitrate solution was then replaced by a 5 per cent *copper acetate* solution and the following results obtained which agree fairly well with those obtained by the copper nitrate method.

<i>Magnesium pyrophosphate from phosphide</i>	Or combined
.258 gm. = 63.48 per cent phosphorus	93.5 per cent
.257 gm. = 63.23 per cent phosphorus	98.15 per cent
.252 gm. = 62.1 per cent phosphorus	97.72 per cent
<i>Magnesium pyrophosphate from filtrate</i>	
.122 gm. = 30.02 per cent phosphorus	
.142 gm. = 34.92 per cent phosphorus	
.145 gm. = 35.62 per cent phosphorus	

When substituting the 10 percent copper nitrate solution by a 10 percent copper sulphate solution the results obtained showed that a greater oxidation of the copper phosphide takes place during the process than when using the nitrate or acetate.

<i>Magnesium pyrophosphate from phosphide</i>	
.199 gm. = 49.0 per cent phosphorus	
.202 gm. = 49.7 per cent phosphorus	
.215 gm. = 52.9 per cent phosphorus	
<i>Magnesium pyrophosphate from filtrate</i>	Or combined
.192 gm. = 47.4 per cent phosphorus	96.4 per cent phosphorus
.182 gm. = 44.8 per cent phosphorus	94.5 per cent phosphorus
.180 gm. = 44.4 per cent phosphorus	97.3 per cent phosphorus

The oxidation was still more marked when using a 10 percent copper chloride solution.

*Magnesium pyrophosphate from phosphide*

.189 gm. = 46.5 per cent phosphorus

.139 gm. = 34.2 per cent phosphorus

.054 gm. = 13.3 per cent phosphorus

*Magnesium pyrophosphate from filtrate*

.187 gm. = 45.9 per cent phosphorus

.205 gm. = 50.4 per cent phosphorus

.359 gm. = 88.0 per cent phosphorus

Or combined

92.4 per cent phosphorus

84.6 per cent phosphorus

101.3 per cent phosphorus

These results are absolutely worthless. As yet we have not been able to find out the cause of these discrepancies. We have made several sets of assays under exactly the same conditions but the results obtained were as varying as those reported. When using copper salts other than the chloride the precipitate of the copper phosphide has a black color, while the chloride produces a precipitate which at first is black but which soon changes to brown, the color of copper phosphide generally described in the text-books on chemistry.

## STABILITY OF SPIRIT OF PHOSPHORUS.

Since the results obtained with copper sulphate and copper chloride were unsatisfactory, we used only the nitrate and acetate in the estimation of the spirit. The estimation was carried out as given in our previous paper, using 10 cc. of the spirit for the estimation.

The following results were obtained:

Copper nitrate	0.0505 gm.	$\text{Mg}_2\text{P}_2\text{O}_7$	=0.141	per cent phosphorus.
"	"	0.050	"	=0.1395
"	"	0.0508	"	=0.142
Copper acetate	0.049	"	"	=0.1368
"	"	0.049	"	=0.1368

In another series of experiments the oxidation products were not removed by shaking out with water, 10 cc. of the spirit were simply mixed with 25 cc. of chloroform, 40 cc. of water and 20 cc. of copper nitrate and copper acetate solution respectively. We thus obtained the following results:

Copper nitrate	0.065 gm.	$\text{Mg}_2\text{P}_2\text{O}_7$	=0.183	per cent phosphorus.
"	"	0.068	"	=0.19
"	"	0.068	"	=0.19
"	"	0.0676	"	=0.189
Average 0.188				
Copper acetate	0.068 gm.	$\text{Mg}_2\text{P}_2\text{O}_7$	=0.19	per cent phosphorus.
"	"	0.066	"	=0.184
"	"	0.066	"	=0.19
"	"	0.069	"	=0.196
Average 0.190				

The results show that about 25 percent of oxidation products are formed when dissolving the phosphorus in the alcohol.

It may be stated that the spirit under examination was prepared with ordinary 95 percent alcohol, the boiling being continued for 12 hours. Upon standing the spirit became cloudy very rapidly and a yellow precipitate was formed.

When applying the copper nitrate method on the same sample of spirit kept at ordinary temperature in small, completely filled bottles at intervals of one month the following results were obtained:

Date of Assay, September 26, 1914.

.0505	gm.	$\text{Mg}_2\text{P}_2\text{O}_7$	=0.1409	per cent elementary phosphorus.

These results show that spirit of phosphorus when kept in completely filled bottles, protected from light, either at ordinary temperature or in a refrigerator keeps fairly well; they also show that at times a somewhat more rapid deterioration takes place, as explained by comparing results obtained in February and March with those obtained in May. We are at present not in a position to say to what causes such a deterioration can be attributed.

That, however, spirit of phosphorus should be kept in completely filled, preferably amber, bottles is shown by the following experiment. About 300 cc. of spirit was left in a 2500 cc. flint bottle. The spirit which was at first slightly turbid, soon became transparent and after the lapse of about three weeks all the elementary phosphorus had disappeared or in other words had been oxidized.

#### STABILITY OF PHOSPHORUS PILLS.

The phosphorus pills used for the examination were made from a paste calculated to contain 10 percent of phosphorus and this paste when assayed according to the following process gave the results indicated below.

About .6 gm. of the paste was mixed in a bottle filled with carbonic acid gas with 20 cc. of water and 50 cc. of chloroform both air-free and the mixture

was shaken for about one-half hour. Tragacanth was then added, the mixture shaken again and, after clearing, an aliquot part of the chloroformic solution was treated with copper nitrate in the regular way. The following results were obtained:

.688 gm. of paste gave	.245 gm.	$\text{Mg}_2\text{P}_2\text{O}_7$	=9.94 per cent
.418 " " "	.145 " "	" "	=9.9 "
.562 " " "	.198 " "	" "	=9.85 "
.423 " " "	.1466 " "	" "	=9.68 "

For making the pills a 10 percent excess of phosphorus paste was added to the calculated amount, in order to meet the deterioration or volatilization which occur during the manufacturing process. The pills were assayed strictly according to the process given in our previous paper.

Although 10 per cent more phosphorus had been added to the pill mass than theoretically required, the pills assayed below the required amount of phosphorus, thus showing that a part of the phosphorus is oxidized during the manufacturing process. It is further shown that a portion of the phosphorus is oxidized on keeping the pills, no matter whether they are coated or uncoated.

The assay of the pills was carried out according to the process outlined in our previous paper with the exception that the shaking of the chloroformic phosphorus solution with the copper nitrate solution was continued for three hours or until the green color of the mixture had acquired a brownish tint due to the formation of copper phosphide. We have found that certain vegetable

matters retard the formation of copper phosphide considerably and unless all the phosphorus has been converted into phosphide the phosphorus cannot be converted into its oxidation products by hydrogen peroxide but will remain as such and appear in the bottle in the form of white fumes.

We also had this experience when determining:

#### STABILITY OF ELIXIR OF PHOSPHORUS, NUX VOMICA AND DAMIANA.

The elixir was prepared from a spirit of phosphorus which assayed 0.1224 per cent of phosphorus. 280 cc. of this spirit was mixed with 720 cc. of elixir of nux vomica and damiana. The elixir thus prepared should contain theoretically 0.035 per cent of phosphorus, viz.: four times the amount required by the product generally found on the market. The elixir was kept in small completely filled amber bottles, protected from light and at ordinary temperature.

These results show that elixir of phosphorus, nux vomica, and damiana keeps well for about five months, after which time a rather rapid dissipation of the yellow phosphorus takes place.

In summing up we find that preparations containing yellow phosphorus keep fairly well under ordinary conditions. Only those preparations which contain vegetable matter are easily decomposed.

RESEARCH LABORATORY OF SHARP & DOHME.

#### REMARKS AND DISCUSSIONS.

Dr. Turner: I merely wish to compliment Dr. Engelhardt on his paper and to point out that the question of determining phosphorus in compounds is a very complicated one. Now we have something which will really enable us to determine the amount of phosphorus in these preparations.

Dr. Dohme: I would like to ask Dr. Engelhardt to what extent the results agree with one another in the various determinations.

Dr. Engelhardt: The experiments were made in duplicate and triplicate and the results vary, I should judge, within the limit of 3 per cent. or 5 per cent. Often the variation was even less. In my opinion the results are particularly satisfactory because with other processes the results obtained were far from being concordant, and in some cases, were absolutely unreliable. I believe we have tried all processes recommended up to the present time

for estimating yellow phosphorus in pharmaceutical preparations and especially the process requiring the destruction of the organic matter and oxidation of the phosphorus by the Kjeldahl method. The fact that the results obtained by this method were not at all concordant may be due to a too rapid oxidation of the phosphorus which manifests itself at times by small explosions.

We have found that with the method outlined by us we can get uniform and satisfactory results and when you get results which remain within the 5 per cent limit and taking even the personal equation into consideration within the 8 per cent limit you should be very well satisfied.

A Member: Are these phosphorus compounds, that is, the therapeutic products, pills, etc., used as extensively as they were some years ago? What is the demand?

Dr. Engelhardt: My impression is that we still make rather large quantities of pharmaceutical preparations containing phosphorus, especially those containing in addition to phosphorus, extract of *nux vomica* and extract of *damiana*. On account of the instability of phosphorus in elixir of phosphorus, *nux vomica* and *damiana* we have quite recently replaced the phosphorus by glycerophosphates. Such a preparation is apparently equally as effective, for we continue to have a great demand for it.

A Member: It is perhaps not germane to the subject, but I should like to ask whether there is any real evidence as to the therapeutic value of either elixir of phosphorus or glycerophosphates?

Dr. Engelhardt: You had better ask the American Medical Association. They claim not.

---

### SEMPERVIRINE FROM GELSEMIUM ROOT\*.

---

A. E. STEVENSON AND L. E. SAYRE.

---

The authors give a method of separating "Sempervirine" from a mixture of the combined alkaloids of gelsemium root, by means of converting the alkaloid into the nitrate which is quite insoluble in water and practically insoluble in solution containing sodium nitrate. Methods of preparing the free alkaloid and some of its salts, a description of these products, and their reactions with the usual alkaloidal reagents are given. In the second part of the paper the authors describe gelseminine which, they claim, consists of at least two alkaloids. They further suggest a method for separation of the various alkaloids of the root and the results of some preliminary physiological experiments carried out with sempervirine, which have shown that the salt apparently has no *immediate* toxic effect, but its definite toxicity is stated.—(Editor.)

At previous annual meetings of this Association, the progress in the investigation of Gelsemium Root has been contributed. In former papers, the various contributions of different authors have been referred to and, at this time, it is unnecessary to repeat the same. It is the desire of the present authors to record in the proceedings of this Association any results of this investigation.

In the present paper, we desire to report further progress in the separation of the various alkaloids of this interesting drug and will confine ourselves very briefly to the method of separation of the alkaloid sempervirine from the total alkaloids of Gelsemium. This report, taken in connection with former

---

\*Presented to Scientific Section, A. Ph. A., San Francisco.

reports, will reveal consecutive steps which have been taken in this investigation.

A.—The crude mixed alkaloids of Gelsemium weighing 25 grams were dissolved in chloroform and extracted with one percent citric acid until practically all the alkaloid was removed from the extraneous material. The acid liquid was made alkaline with ammonia water and completely extracted with chloroform. The alkaloid was then again extracted from the chloroform using one percent hydrochloric acid. Each successive extraction was tested by adding a few drops of saturated solution of sodium nitrate which precipitates the sempervirine. When no further precipitate was obtained the extracts previously obtained were combined and a saturated solution of sodium nitrate added, drop by drop with stirring, until no further precipitate was obtained. This precipitate consisted of sempervirine nitrate. The alkaloid, as stated in previous papers, forms a nitrate, quite insoluble in water and practically insoluble in solution containing sodium nitrate.

B.—*Purification of the Sempervirine Nitrate.* The sempervirine nitrate was filtered off and washed free from mother liquor with a weak solution of  $\text{NaNO}_3$  and the  $\text{NaNO}_3$  solution removed by washing drop by drop with distilled water. The sempervirine nitrate was washed with distilled water into a beaker and heated on a boiling water bath until it dissolved. The solution was filtered off and the nitrate reprecipitated by adding a few drops of a saturated solution of  $\text{NaNO}_3$ . It was then filtered off and washed as before with weak  $\text{NaNO}_3$  solution. This process of solution and reprecipitation was repeated three or four times. Finally the sempervirine nitrate was dried on porous plate and recrystallized from hot alcohol from which it separated in yellow needle shaped crystals.

C.—*Preparation of the Free Alkaloid.* The nitrate was dissolved in hot water, the solution made alkaline with  $\text{NH}_4\text{OH}$  and the alkaloid extracted with  $\text{CHCl}_3$ . The major portion of the  $\text{CHCl}_3$  was distilled off. On allowing the residue to cool the alkaloid crystallized out in reddish brown needles.

D.—*The Hydrochloride, Preparation of.* The hydrochloride was prepared from the free alkaloid in a manner analogous to the preparation of the nitrate, the alkaloid being dissolved in one percent  $\text{HCl}$  and precipitated out by adding saturated solution of  $\text{NaCl}$ . It was dried on porous plate and separated from the  $\text{NaCl}$  present by dissolving in alcohol in which it is quite soluble.

It may be obtained in a crystalline form by dissolving in a small amount of absolute alcohol, heating the alcohol solution to boiling and adding 4 or 5 volumes of hot  $\text{CHCl}_3$ . On cooling and standing for some time, the hydrochloride separates out in yellow microscopical needles. The hydrochloride dissolves readily in alcohol and water. It is very slightly soluble in chloroform.

E.—*Some Characteristics of the Alkaloid and Its Salts.* The free alkaloid, as stated before, crystallizes from chloroform in reddish-brown needles. Its chloroformic solution is very dark in color, ranging from yellow, in very dilute solutions, to a dark reddish-brown, in saturated solutions. It is somewhat soluble in alcohol, very slightly soluble in water, almost insoluble in ether, benzol, and petroleum ether.

It dissolves in concentrated  $\text{H}_2\text{SO}_4$  with reddish-brown color, the solution giving no change in color on adding a crystal of  $\text{K}_2\text{Cr}_2\text{O}_7$ . When heated, it fused together at about  $220^\circ$ , but did not melt even when heated to  $280^\circ$ , above which temperature it was not heated. At this temperature, it was in the form of a black mass.

The hydrochloride fused together at  $310^\circ$ , but was not completely melted at this temperature. It was not heated higher than this.

An aqueous solution of the hydrochloride gives the following reactions:

With  $\text{NaNO}_3$  solution, a yellowish precipitate.

With Mayer's Reagent, a yellow precipitate.

With Wagner's Reagent, a reddish-brown precipitate.

With Tannic Acid solution, a yellowish precipitate.

With Picric Acid solution, a yellow precipitate.

Yellow amorphous precipitates with potassium ferrocyanide and potassium ferricyanide solutions.

With  $\text{KCrO}_4$  solution, a yellow precipitate.

With platinum chloride, a yellowish-white precipitate.

The hydrochloride may be precipitated from its solution by adding a small amount of sodium chloride solution.

The solution of hydrochloride gives no precipitate with phosphoric, sulphuric, oxalic, tartaric or citric acids.

The percentage of sempervirine in gelsemium is small. About 0.8 gram was obtained from the 25 grams of alkaloidal material which represented the alkaloids from 25 pounds of the drug.

*F.—The Filtrate from the Sempervirine Nitrate*, together with further acid washings of the  $\text{CHCl}_3$  solution which did not give a precipitate with  $\text{NaNO}_3$ , were extracted with several successive portions of benzol, using in all about three times the volume of the acid solution. This removed the greater part of the gelsemic acid. The acid liquid was then extracted with several successive portions of  $\text{CHCl}_3$ , using in all about four times the volume of the acid liquid. The chloroform removed the remainder of the gelsemic acid, the remainder of the sempervirine as the hydrochloride and also would undoubtedly remove at least traces of the hydrochlorides of all other alkaloids present, since such a large amount of  $\text{CHCl}_3$  was used.

*G.—The Chloroformic Solution.* The chloroformic solution was filtered and the greater part of the  $\text{CHCl}_3$  distilled off. The remainder was shaken with several small portions of water, until the hydrochlorides of the alkaloids were removed. The residual  $\text{CHCl}_3$  was rejected. The aqueous solution was evaporated with a small amount of sand (sand being added to facilitate subsequent extraction) at a low temperature to dryness, the residue transferred to a flask and extracted with several successive portions of acetone. Sempervirine hydrochloride, which had not been precipitated with  $\text{NaNO}_3$ , is left with the sand from which it was extracted with alcohol.

The acetone solution was evaporated to dryness at a low temperature and the residue dissolved in water. (Not all of it went into solution.) The filtered solution was treated, drop by drop, with a saturated solution of  $\text{NaCl}$ . A small quantity of a yellow alkaloidal precipitate was obtained at first, the precipitate gradually becoming whiter. The first portion of the precipitate

was filtered off and the succeeding precipitate produced by NaCl was collected separately. This latter precipitate was dried on porous plate and dissolved in alcohol from which it separated in crystalline form. The crystals were almost colorless, slowly soluble in water and melted at  $282^{\circ}$  with decomposition.

A small amount of alkaloid hydrochloride remained in solution after saturating with NaCl. The solution was made alkaline with  $\text{NH}_4\text{OH}$  and the alkaloid extracted with  $\text{CHCl}_3$ . On evaporating the  $\text{CHCl}_3$ , a bitter amorphous residue with a pyridine-like odor was obtained. All of these alkaloidal products obtained here were very small in quantity.

*H.—Acid Solution which had been Extracted with Benzol and  $\text{CHCl}_3$ .* This acid solution was exactly neutralized to litmus with NaOH solution and evaporated at a low temperature. The dry residue was extracted with alcohol leaving behind NaCl and gelsemine hydrochloride, while a small quantity of gelsemine hydrochloride, and all of the gelseminine hydrochloride was dissolved. To remove as much as possible of the gelsemine hydrochloride, part of the alcohol was removed by distillation and the concentrated solution allowed to stand for a few days when a small amount of gelsemine hydrochloride separated out. The solution was filtered off and evaporated with sand at a low temperature. The residue was transferred to a flask and extracted with several successive portions of acetone. A small amount of alkaloidal hydrochloride remained in residue and was not extracted by the acetone.

This residue was dissolved with alcohol and, on evaporation of the alcohol, gave a crystalline hydrochloride. The hydrochloride was dissolved in water and the solution filtered. To the filtrate a saturated solution of NaCl was added which gave a small amount of yellow precipitate. This precipitate was not examined further. On adding more NaCl solution and even after saturating with NaCl, there was no further precipitate, but the hydrochloride of an alkaloid remained in solution. This was precipitated with  $\text{NH}_4\text{OH}$ , the precipitate collected, washed with water and dried. It was redissolved in alcohol, but did not separate in a crystalline form (labeled Alk. A.).

*I.—Gelseminine.* The acetone solution obtained in "H" was evaporated, the residue dissolved in water and the solution filtered. On adding to the solution a saturated solution of NaCl, there was produced with a small amount of NaCl solution a dark colored precipitate, while on adding more NaCl solution to the filtrate from this a further lighter colored precipitate was formed. After saturating with NaCl, there still remained some alkaloidal hydrochloride in the solution (precipitates labeled, first, *Precipitate with NaCl* and, second, *Precipitate with NaCl*, respectively).

It seems that gelseminine must consist of at least two alkaloids. This is indicated First, by the fact that the hydrochloride of one is more easily salted out from its solution than that of the other, the hydrochloride first separating out being much darker in color than that separated on further addition of NaCl solution. Second, if the free alkaloid be dissolved in a small amount of alcohol and ether\* added, a very dark colored alkaloid is precipitated out

---

\*The ether solution corresponds to what we have employed in physiological tests as gelseminine.

while one much lighter in color remains in solution. Neither of these two methods of fractional precipitation gives a sharp separation into two constituents and it could probably only be determined by an ultimate analysis of the two products or by comparison of physiological effects whether these are really two different products. The physiological method would apparently be the better test to use since it would require less material and less work.

SUGGESTED METHOD FOR SEPARATION OF ALKALOIDS OF GELSEMIUM.

A.—Extract Gelsemium with 90 percent alcohol. Evaporate at a low temperature. Add water to precipitate resinous matter and filter. Wash residue with distilled water. Make the combined filtrate and washings alkaline with  $\text{NH}_4\text{OH}$  and extract completely with  $\text{CHCl}_3$ . Filter the combined  $\text{CHCl}_3$  extracts and distil off the greater part of the  $\text{CHCl}_3$ . Extract the alkaloid from  $\text{CHCl}_3$  residue with one percent  $\text{HCl}$ . To the acid washings add a saturated solution of  $\text{NaNO}_3$  until no further precipitate is formed, avoiding an excess of  $\text{NaNO}_3$ .

NOTES—The saturated solution of  $\text{NaNO}_3$  need not be added to the whole of the acid washings. Each successive acid washing may be tested with  $\text{NaNO}_3$  solution until a washing is obtained which does not give a precipitate with  $\text{NaNO}_3$ . The  $\text{NaNO}_3$  solution need then be added only to the combined washings obtained previous to this washing which does not give a precipitate with  $\text{NaNO}_3$  solution.

B.—(1) *Purification of the Sempervirine Nitrate.* Wash the nitrate on the filter paper with a 5 percent solution of  $\text{NaNO}_3$  until free from the mother liquor. Wash the precipitate then drop by drop with distilled water until practically free from  $\text{NaNO}_3$  solution, rejecting the first portions of the washings, but collecting the succeeding portions. (This collection of succeeding portions is necessary since, as soon as the greater part of the  $\text{NaNO}_3$  solution is removed, the sempervirine nitrate dissolves to a slight extent). When washed free from  $\text{NaNO}_3$ , transfer the sempervirine nitrate to a beaker and heat with distilled water on a boiling water bath until solution is effected. Filter, add the portion of the washings collected above, and also a few drops of a saturated solution of  $\text{NaNO}_3$ . Filter off the precipitated sempervirine nitrate and proceed as before. Repeat this three or four times. Finally dry the sempervirine nitrate on porous plate and then recrystallize from hot alcohol.

(2) *Preparation of Free Alkaloid from Nitrate.* Dissolve the nitrate in hot water and add  $\text{NH}_4\text{OH}$  to the solution. Extract the alkaloid with  $\text{CHCl}_3$ . Distil off the major portion of the  $\text{CHCl}_3$  and allow to crystallize.

(3) *Preparation of Hydrochloride from the Alkaloid.* Dissolve the free alkaloid in one percent  $\text{HCl}$ , filter and add a saturated solution of  $\text{NaCl}$ . Proceed as under B (1) except that an  $\text{NaCl}$  solution is used instead of an  $\text{NaNO}_3$  solution.

C.—Proceed with the extraction as directed under A until the alkaloids are extracted. Combine these washings with the filtrate from the sempervirine nitrate and extract with several portions of benzol, using in all a quantity of benzol equal to about three times the volume of the acid washings. This removes the greater part of the gelsemic acid. Distil off benzol to get acid. Then extract the acid liquid with several portions of  $\text{CHCl}_3$  using in all

three or four times the volume of the former. This will remove the remainder of the sempervirine as the hydrochloride, together with some other alkaloidal material, also any remaining gelsemic acid. Distil off the greater part of the  $\text{CHCl}_3$  and shake the residue with several portions of distilled water. This will transfer the hydrochlorides of the alkaloids to the aqueous liquid. Mix the combined aqueous extracts with some sand and evaporate at a low temperature. Extract the residue with acetone. Sempervirine hydrochloride is left behind with the sand from which it may be extracted with alcohol.

The acetone solution may be further treated as above.

*D.*—The acid liquid which has been extracted with benzol and  $\text{CHCl}_3$  is made just neutral with  $\text{NaOH}$  and evaporated to dryness at a low temperature. The residue is treated with alcohol in small amounts which leaves behind  $\text{NaCl}$  and gelsemine hydrochloride. In solution we have a small amount of gelsemine hydrochloride together with gelseminine hydrochloride and any other alcohol soluble hydrochlorides. This alcoholic solution is evaporated to a small volume and allowed to stand for some time when the major portion of the gelsemine hydrochloride will separate out. Filter, mix the filtrate with sand and evaporate at a low temperature. Extract the residue with acetone. The so-called gelseminine hydrochloride goes into solution while a small amount of alkaloidal material remains in the sand from which it may be extracted with alcohol.

**Physiological Test:** Thus far no complete pharmacological data has been obtained concerning this alkaloid. It may be stated, however, that 1 cc. of the solution of the hydrochloride containing 0.001 gm. of the salt killed a guinea pig weighing 90 gms. in 48 hours. A mouse weighing about 20 gms. with the same dose died in the same time, the salt having no *immediate* toxic effect.

**NOTE:** For the crude material containing the mixed alkaloids we are indebted to Messrs. Eli Lilly and Company and for crude and authentic material in working up former papers we are indebted to J. U. Lloyd, Parke, Davis and Company and H. K. Mulford Company. For their generous supply of material we desire to express our thanks.

**Toxicity of Sempervirine:** A report from the pharmacological laboratory of Parke, Davis & Co., gives the toxicity of Sempervirine as Minimum Lethal Dose = 0.00014 gm. per gram weight of frog. For this report the writer is indebted to Dr. E. M. Houghton.

---

## LEUCOCYTIC EXTRACT—ITS PREPARATION AND USES.\*

---

ARTHUR R. MEINHARD.

---

It is now a well established fact that one of the chief forms of protection of the animal body to bacterial invasion is through the action of certain of the white blood cells or the so-called phagocytic cells. These cells, which are easily able to wander through the walls of the blood vessels, are drawn by positive chemotactic action to the infected area and act by ingesting the trouble causing bacteria, destroying them and neutralizing their poisons. It is the purpose of this paper to dwell especially upon the nature of these poison neutralizing sub-

---

\* Contributed to the Scientific Section, American Pharmaceutical Association, San Francisco, 1915.

stances in the leucocytes, methods whereby they can be obtained from the lower animals for use in human infections, and their use in medicine.

Bacteria may be divided into two general classes, according to their poison producing powers; first, those which secrete soluble toxins of which the tetanus and diphtheria bacilli are examples, and second, those that do not secrete soluble toxins in which the poison or endotoxin is more or less fixed to the bacterial body. Examples of these are the pneumococcus, meningococcus, and typhoid bacillus.

Curative sera are easily obtained for the first of these two classes of bacteria by the injection into animals of graduated amounts of toxin which results in the formation in the blood of the immunized animal of an anti-toxin. In this way are procured tetanus and diphtheria anti-toxin.

The production of an anti-toxin for this second group of bacteria has not met with any success. The injection of these endo-toxins into an animal results not in the production of an anti-toxin but in the production of bactericidal and bacteriolytic substances.

Immune sera have been prepared for the treatment of streptococcus and pneumococcus infections, but the action of these sera is probably due to the bactericidal powers of the serum and to an increase of immune bodies, the so-called opsonins of Wright or the bacteriotropins which may or may not be the same immune body. These bodies attach themselves to the invading bacteria and render them more susceptible to the action of the leucocytes, and not to anti-toxins in the serum. The use of these sera has not met with as great success as has the use of anti-toxins.

As mentioned above, one method of action of the leucocytes on the bacterial body is through the preparation of the bacteria by the opsonins for ingestion by the leucocytes. The amount of this immune body in the serum controls the extent to which the bacteria are taken up by the leucocytes, destroyed, and their contained poisons neutralized by the ferment termed by Petterson<sup>1</sup> endolysin.

Hiss<sup>2</sup> however speaks of another form of leucocytic action upon bacteria which is independent of the amount of opsonin in the serum. There is a gradual depression of the phagocytic action of the leucocytes up to the height of the infection, and then an increase in action as the infection terminates. It was with this theory in view that Hiss<sup>3</sup> made the following statement: "In many diseases we are dealing probably with an immunity a large part of whose mechanism is individually cellular, not only in the sense of phagocytosis and digestion but in the neutralization of poisons given rise to by the disintegration of the bacteria, a mechanism in which the protecting cells must intervene and unaided by bodies in the plasma, neutralize within themselves the poisonous products of the invading microorganisms."

With this hypothesis in view Hiss<sup>4</sup> and later Hiss and Zinsser<sup>5</sup> undertook a series of experiments to see if they could obtain suitable extracts of leucocytes containing these neutralizing bodies in solution for the treatment of various infections, and to study the action of these leucocytic extracts upon different bacteria. Theoretically, such extracts if containing this poison neutralizing substance or endolysin in solution, should when injected into the bodies of human beings or other animals rapidly diffuse through the blood stream and neutralize the toxins or other poisonous substances, in this way com-

ing to the aid of and relieving the leucocytes for the time being and allowing them to form new endolysins within themselves.

The method finally used by Hiss after much experiment for obtaining leucocytic extracts was as follows and is much the same method as is in use today. Rabbits of about 2000 grammes weight were tied down, the thoracic region shaved and sterilized and ten cubic centimeters of aleuronat mixture injected into each pleural cavity, between the intercostal spaces, care being taken to avoid puncturing the lungs. The aleuronat mixture was prepared by dissolving 3% starch and 5% aleuronat in cold meat infusion broth then boiling over a free flame for five minutes and finally filling into large test tubes and sterilizing in an autoclave. At the end of 18 to 24 hours the injected animals were killed, the pleural cavities opened, and the contained cloudy fluid consisting of serum, leucocytes and some erythrocytes, put into sterile centrifuge tubes and centrifuged at high speed until the supernatant serum was clear and then this serum was poured off. The leucocytes were then extracted in distilled water in an incubator for six or eight hours, then the extract examined bacteriologically for sterility and if sterile was used.

The first experiments of Hiss were on rabbits injected with large doses of staphylococcus. That the strain used was virulent was shown by the death in every case of the animals used as controls, while the other animals which were given small doses of leucocytic extract at intervals of one to five hours after the injection of the bacteria either completely recovered or lived for much longer period of time than did the control animals.

Later, further experiments were carried on by Hiss and Zinsser<sup>6</sup> on rabbits, using pneumococcus, typhoid bacilli, and meningococcus. Here the results were about the same as mentioned above, and further, some of the animals recovered when leucocytic extract was not given until 24 hours after a dose of bacteria had been given, large enough to kill the control animals. In these experiments was shown beautifully the resulting drop in temperature after an injection of leucocytic extract showing a neutralization of the poisons.

In view of these successful experiments it was thought advisable to try leucocytic extract upon human beings. It was first tried on 24 people suffering from meningococcus infection. Most of these cases were of the severe type or came under treatment late in the disease when the infection had brought about a state of grave toxæmia, and great emaciation. Two of these cases left the hospital before treatment was fully established, fourteen were discharged as cured and eight died, which calculated in percentages gives 63.6% cured and 36.4% fatal. The injections of leucocytic extract resulted in an improvement of the symptoms depending upon the central nervous system, and vomiting, delirium, stupor and hyperæsthesia were either greatly diminished or disappeared after one or two injections of from five to twenty-five cc. of the extract. There was also a marked reduction in the temperatures.

Seven cases of lobar pneumonia were also treated with the extract. Here there was a recovery of 100% of the cases treated. Here also there was the characteristic drop in temperature, and a change for the better in the subjective symptoms.

Later eleven cases of staphylococcus infection were treated by the same authors<sup>7</sup> with splendid results. Eight of these were cases of chronic furun-

culosis which had lasted in spite of surgical and dietetic treatment for periods of from a few months to some years. In all but one of these cases there was a complete cure made, while in three acute cases treated the same results followed.

Floyd and Lucas<sup>8</sup> reported the use of leucocytic extract in forty cases of pneumonia with a mortality of 12% while in a series of twenty-five cases not treated with leucocytic extract the mortality was more than doubled.

Lambert<sup>9</sup> treated a number of cases, most of them being erysipelas, with results which in his opinion warranted further trials.

Meinhard<sup>10</sup> in experiments upon thirty-nine rabbits and using four times the dose of pneumococcus necessary to kill these animals showed a mortality for the control animals not treated with leucocytic extract of nearly 100%, with recovery of almost 100% for treated animals, although some of these animals did not receive the extract until nearly forty-eight hours after the initial injection of pneumococcus. In these experiments was noted the typical fall of temperature and increase of appetite following the injections of the extract. A small amount of preservative was used for the first time in these experiments and shown to be of no harm to the potency of the extract. A further improvement was also made in the extract by adding a strong solution of sodium chloride to the extracted leucocytes, enough of this salt solution being added to make the extract of physiological salt solution strength. This was done as it had been shown that when the watery solution of the extract was injected it was very painful, while injections of physiological salt solution were not.

Reynolds<sup>11</sup> reporting a series of nine cases of pneumonia with 100% recoveries remarks: "A complete description of these cases represents a severe form of pneumonia running a full course with moderate temperature curve, scarcely noticeable delirium, comparative freedom from toxic effects on the kidneys, and terminating by crisis at the usual time."

Besides these cases reported leucocytic extract has been used with great success on the Pacific Coast for the treatment of lobar pneumonia but as yet many of these cases have not been reported.

Reviewing these cases it is easy to see that leucocytic extract is of use in neutralizing bacterial poisons in the animal body as evidenced by the fall in temperature, general lessening of toxic symptoms and decrease of central nervous system symptoms. It also in neutralizing these poisons gives the leucocytes a chance to recuperate and form new endolysins.

## COLOR REACTIONS\*.

---

E. A. RUDDIMAN.

---

The author presents reasons for variations in color reactions and refers to defective vision of individuals as one of the dangers for wrong conclusions from color tests.—[EDITOR]

Some years ago the writer made a compilation of color tests of thirty-five alkaloids and eighteen other organic compounds. In doing so it soon became evident that authorities differed widely in the statement of the color produced by a given reagent on a given compound. Recently I have been checking over these tests and have come to the conclusion that the following conditions will account for the variation.

1. There is a great difference in eye-sight and in the power to distinguish colors and shades of colors. What looks like a certain color to one person will resemble another color to a different observer. This defect in some people amounts almost if not entirely to color blindness.

2. There is no recognized standard adopted by chemists with which to compare colors. A certain color can be called a violet-red or a red-violet and both be correct. It is difficult to distinguish the shades, for instance, as they pass from yellow through orange to brown and it is still more difficult to describe them so that another person will catch them. It is to be regretted that there seems to be no convenient standard available for small laboratories so that one writer in describing a color could call it by the name and number of the standard color with which it agrees. The only book of which the writer knows gives about 4000 shades and costs \$8.00. A few charts with perhaps 100 to 200 colors would be of great use, provided the colors could be made permanent.

3. The impurities occurring in alkaloids and other compounds will account for some variation. Principles as obtained from drugs and preparations in analytical work are frequently contaminated with foreign matter or are mixtures of several principles, as in case of *sabadilla* or *pomegranate* alkaloids. These impurities may modify the color, entirely cover it up, or destroy it. In some cases, as with *digitalis* glucosides or *aconite* alkaloids, manufacturers put up different compounds under identical names. Moreover, some chemicals change on keeping and give different results, as *apomorphine* and *apocodeine*.

4. Reagents sometimes have impurities in them which modify the colors, as iron or nitric acid in sulphuric acid.

5. Several reagents are made up with sulphuric acid as the solvent. Sulphuric acid being so hygroscopic, it will contain variable amounts of water. If the container of such a reagent is opened frequently for a week, enough water may be absorbed so that no color is obtained when there should be one. Reagents, like *Froehde's* formaldehyde in sulphuric acid, or ammonium selenite in sulphuric acid should be made up frequently.

---

\*Presented to Scientific Section, A. Ph. A., San Francisco Meeting.

6. The variation in strength of reagents may give different results. Some workers in making up Froehde's reagent use 0.05 gm., others 0.1 gm. up as high as 1.0 gm. for every 10 cc. of sulphuric acid.

7. The actual amount taken of the compound being tested, the amount of the reagent applied, and the proportion of reagent to the compound in certain cases cause a variation. Occasionally where the weight of the compound is directed, it is so much larger than it is possible to get in commercial analysis, the test is of but little value.

8. The order of mixing, whether the reagent is added to the compound or the compound to the reagent, which is in excess, may cause some variation.

9. On adding a reagent the color produced may be permanent, or it may change slowly requiring several minutes or even hours, or it may change very rapidly. The amount of substance being tested will often cause a variation in the time required for the change. Different workers may catch these colors at different stages of change. In analytical work it is impossible to use the same amount of substance each time or as the original test called for.

10. Some tests require the application of heat. The degree of heat and the rapidity with which it is applied in some cases causes a variation.

Since we must depend so largely on color tests for the identification of alkaloids and some other organic compounds, it is unfortunate that so many factors must be considered. To eliminate these as far as possible I would suggest to those who report results from color reagents: That they test the reagents used; that they state the strength of the reagent; that the reagent be added to the compound being tested, or if any other order be followed, it be so stated; that the amount of substance being tested be small, approximating what might be expected in making an analytical examination; that the amount of reagent added be one or two drops from a small stirring rod or dropper, unless otherwise stated; that if heat is to be used, the mixture of substance and reagent be placed on a bath in which the water is already boiling; that the name of the manufacturer of the alkaloid be given, where there is any doubt as to its purity.

---

#### ESTIMATION OF ATOXYL.\*

---

H. ENGELHARDT AND O. E. WINTERS.

---

Quite recently we have had occasion to examine tablets for the amount of atoxyl present. Several methods for estimating atoxyl have been proposed and in order to find out the most reliable one the following assay methods were tried.

I—Sulphurous acid method.<sup>1</sup>

II—The method proposed by Norton and Koch for estimating arsenic in presence of organic matter in a modified form.<sup>2</sup>

III—The method of the German Pharmacopœia.

IV—Method of the German Pharmacopœia modified.<sup>3</sup>

---

\*Read in Scientific Section A. Ph. A., San Francisco meeting.

<sup>1</sup>Puckner and Clark (Journ. Amer. Med. Assn. 1907, p. 1011).

<sup>2</sup>Ibid, Norton and Koch (Jour. Amer. Chem. Sec. 1905, p. 1247).

<sup>3</sup>Rupp and Lehman (Apoth. Zeit. 1911, p. 203).

V—W. Dullière's method.<sup>4</sup>

VI—Bougeault's hypophosphite method.<sup>5</sup>

The methods are carried out as follows:

*Method I*—A weighed quantity of atoxyl is placed in a strong flask of about 150 cc. capacity, 50 cc. of a freshly prepared saturated solution of sulphur dioxide added, and the flask stoppered with a sound cork tied down firmly. The flask and contents are heated in a water-bath for one hour, allowed to cool, the contents transferred to an Erlenmeyer flask and evaporated on a water-bath until all sulphur dioxide is expelled. After cooling the solution is made nearly neutral with sodium hydroxide, 2 gms. sodium bicarbonate added and the arsenic titrated with N/10 iodine V.S. using starch as an indicator.

When applying the method to a sample of atoxyl the following results were obtained:

Method I—26.58 per cent arsenic		
22.61	“	“
25.70	“	“
25.60	“	“

*Method II*—A weighed quantity of atoxyl is placed in a Kjeldahl flask and digested with 20 cc. of concentrated sulphuric acid until clear and nearly colorless. The mixture is transferred to a flask, using about 100 cc. of water to complete the transfer, made neutral with sodium hydroxide, 2 gms. sodium bicarbonate added and the arsenic titrated with N/10 iodine V.S.

The following results were obtained:

Method II—24.7 per cent arsenic		
24.5	“	“

This method is rather tedious and cumbersome. It takes almost six hours to oxidize the atoxyl.

*Method III*—2 gm. of atoxyl is mixed in a flask with 10 cc. of sulphuric acid and one cc. of fuming nitric acid and the mixture heated to boiling and boiled for one hour. After cooling two successive portions of each 50 cc. of water are carefully added and each portion is again removed by boiling. The residue is then diluted with 10 cc. of water, allowed to cool and mixed with 2 gms. of potassium iodide and 5 cc. of water, and finally sufficient water is added to dissolve any precipitate formed. After allowing the mixtures to stand for one half hour the iodine is titrated with N/10 sodium thiosulphate solution, each cubic centimeter of the latter corresponding to .003748 gms. of arsenic.

The following results were obtained:

Method III—27.3 per cent arsenic		
27.18	“	“
26.80	“	“

*Method IV*—2 gm. of atoxyl is mixed in a 200 cc. flask with 10 cc. of concentrated sulphuric acid and the mixture heated on a water-bath at about 70°. One gram of crystallized potassium permanganate is then added in small portion shaking well after the addition of each portion, additional permanganate being added only when the evolution of gas has ceased. To the mixture, drop by drop 5 to 10 cc. of hydrogen peroxide solution is added until the brown color has disappeared and the solution has become limpid: The liquid is diluted with

<sup>4</sup>W. Dullière (Journ. Pharm. et Chim. 1912, p. 567).

<sup>5</sup>Bougeault (Journ. pharm. et chim. 1903, p. 97 and 1907, p. 13).

20 cc. of water, boiled 10 to 15 minutes and again diluted with 50 cc. of water. After cooling 2 gms. of potassium iodide is added, the mixture allowed to stand in a well-closed flask for one hour and the liberated iodine titrated in the usual way with N/10 sodium thiosulphate solution. The results obtained were the following:

Method IV—26.98 per cent arsenic		
26.98	"	"
26.98	"	"
27.0	"	"
27.0	"	"
27.0	"	"

*Method V*—.5 gm. of atoxyl is dissolved in 25 cc. of water, 20 cc. of N/10 silver nitrate solution are added and then sufficient water to make 50 cc. The liquid is mixed thoroughly and filtered. 25 cc. of the filtrate are mixed with ferric alum solution and a few drops of nitric acid and the excess of the silver nitrate is titrated back by ammonium sulphocyanide solution. The number of cubic centimeters of silver nitrate solution multiplied by .0075 would represent the amount of arsenic, if the silver atoxyl were completely insoluble in water. Since, however, this is not the case, the portion soluble in water should be taken into consideration and for this purpose .9 cc. should be added to the total amount of silver nitrate solution after subtracting the amount of sulphocyanide solution used for retitration.

The results were as follows:

Method V—25.91 per cent arsenic		
25.94	"	"
27.24	"	"
27.39	"	"
27.39	"	"

*Method VI*—Atoxyl when treated with hypophosphorous acid in the cold is polymerized. This polymeric product is oxidized by iodine to amino-phenylarsenic acid. The reducing agent is obtained by dissolving 20 gms. of sodium hypophosphite in 20 cc. of water, adding to the solution 200 cc. of hydrochloric acid (1.17) and decanting the clear liquid from the separated sodium chloride. .15 to .2 gm. of atoxyl is dissolved in 1 or 2 cc. of water, the solution mixed with 15 to 20 cc. of the reducing agent and allowed to stand for 24 hours. The mixture is diluted with 15 to 20 cc. of water, the precipitate separated by filtration, washed well with diluted hydrochloric acid and is then treated for one-quarter hour with an excess of N/10 iodine solution. The excess of iodine is titrated back with N/10 sodium thiosulphate. We obtained the following results:

Method VI—37.5 per cent arsenic		
28.0	"	"
17.26	"	"
21.56	"	"

These results show that Method VI is almost worthless. When filtering and washing the yellow precipitate produced with hypophosphorous acid, at times a great amount of the precipitate goes through the filter.

We found that the modification of the method of the German Pharmacopoeia works very well and gives satisfactory results.

The above figures further show that the salt used for the experiments which had been kept for about one year in a partly filled bottle, probably had lost some of its water of crystallization and contained only about two molecules of water.

Atoxyl with 3 molecules of water contains 25.59 percent of arsenic, with 2 molecules of water 27.3 percent of arsenic.

Considering the toxic character of atoxyl, great care should be taken in analyzing the product and arranging the dose according to the amount of arsenic.

It is interesting to note the varying composition of atoxyl in regard to water given in the literature. Thus Ehrlich and Berthelm<sup>6</sup> report 4 molecules. Bechamp<sup>7</sup> gives atoxyl with 5 molecules of water and when recrystallized from water with 6 molecules. When, however, recrystallized from an aqueous-alcoholic liquid the salt crystallized with only 2 molecules. Fournau<sup>8</sup> claims that atoxyl crystallizes with 5 molecules and that it loses all the water but two molecules when exposed to the air. Moore, Nierenstein and Todd<sup>9</sup> report 3 molecules of water of crystallization.

We then examined tablets of different grainage both by the method of the German Pharmacopœia and its modification and obtained the following results:

German Pharmacopœia.		German Pharmacopœia modified.		
$\frac{1}{3}$ gr.	0.3114 gr.= 93.4 per cent	{ 0.323 gr.= 96.9 per cent		
		{ 0.3126 " = 93.7 "		
1 gr.	0.993 " = 99.3 "	{ 0.977 " = 97.9 "		
		{ 1.0006 " = 100.06 "		
3 gr.	2.83 " = 94.3 "	2.79 " = 93 "		
5 gr.	5.05 " = 101 "	{ 4.9 " = 98 "		
		{ 4.99 " = 99.9 "		

The calculation was based on atoxyl containing 3 molecules of water of crystallization.

Although this paper does not bring out anything new, we thought it might be interesting to compile the various methods offered for estimating atoxyl and scattered throughout the literature and give our experience with these methods. So far all experiments with estimating atoxyl in pills and tablets containing also Blaud's mass have failed, but we hope to report on a reliable method in the near future. The large amount of iron in the combination (5 grains Blaud's mass and  $\frac{1}{3}$  grain atoxyl) greatly disturbs the estimation.

ANALYTICAL LABORATORY OF SHARP & DOHME.

## DISCUSSION.

Dr. Dohme: I would like to ask whether any steps were taken to determine whether the tested atoxyl contained varying amounts of water of crystallization or not?

Dr. Engelhardt: The atoxyl which was taken for the estimation was an old sample which contained about two molecules of water of crystallization. We expect to continue the experiments with atoxyl containing varying amounts of water of crystallization in connection with the determination of atoxyl in the presence of Blaud's mass.

## TINCTURES\*.

---

WILBUR L. SCOVILLE.

---

The following paper presents a comparison of tinctures made by percolation of drugs and by diluting fluidextracts. A purpose of the work undertaken was to determine the relative stability of the two classes of tinctures.—[EDITOR].

In the fall of 1912 a series of tinctures was made in order to ascertain what differences, if any, could be observed between a tincture prepared by the official process from the drug and one made by diluting the corresponding fluidextract with the proper menstruum.

Forty-six of the Pharmacopoeial tinctures were made by the official process, in lots of 500 cc. to 2000 cc. each, according to the quantities which would be needed in making subsequent tests. The drugs were taken from stock and were all of good quality, though no special selection was made in any case, and the official process was carefully followed in making the tinctures. At the same time a line of the same tinctures was made by diluting the corresponding fluidextracts according to directions on the labels, the fluidextracts also being taken from stock without special selection in any case.

It is at once apparent that since different lots of drug of the same kind vary in strength, in soluble extractive, and to some extent in color, that the two corresponding tinctures would not be absolutely comparable because the fluidextract used was made from a different lot of drug than the official tincture. But the purpose of the investigation was not to see how closely the tinctures could be made to compare by the two methods, but to note such differences as might be found under ordinary commercial conditions.

When the tinctures were finished each was tested for specific gravity, alcohol strength, dry extractive and the standardized tinctures were assayed for alkaloidal strength. A comparison of the color and brilliancy of each pair of tinctures was also made.

The tinctures were stored in amber glass bottles in a diffused light, and under the ordinary temperature changes of a working laboratory. The bottles were all full at first, but as tests were made some of each was taken out and the bottle re-stoppered, leaving increasingly voluminous air-spaces above the liquids. At the end of the two years from half to seven-eighths of each tincture had been removed.

The extractive-estimations and alkaloidal assays were repeated at the end of the first year, and all the tests at the end of the second year. The results are shown in the following table:

The specific gravities were taken the first time with a 50 cc. pycnometer on an ordinary prescription balance, and the second time a 100 cc. pycnometer was used on the same balance. The gravities are thus approximate only.

Alcohol estimations were made by diluting one part of the tincture with two parts of water and distilling two parts. The alcohol was then calculated from the specific gravity of the distillate. When volatile oils or other volatile substances are present in a tincture, these will come over in varying quantities, depending upon the rate of distillation and the amount distilled. This affects the specific gravity and consequently the results, and a variation of one percent on different estimations is within the ordinary limits of error. Hence it is not considered that any actual change in alcohol strength occurred in the two years unless the difference is decided.

In the greater number of instances the second estimation shows results slightly lower than the first, which may indicate a tendency to loss in alcohol strength, but in no instance is the difference great enough to draw positive conclusions, and there are numerous instances of reverse results.

When marked precipitation has occurred the second results are often higher than the first, as might be expected, but here again the differences are too small to be important.

The only instance of marked difference between the two tinctures of a pair is in the case of Tincture of Belladonna. The official tincture is made with a menstruum of diluted alcohol while the fluidextract is made with a menstruum of about 75 percent alcohol. In making the tincture, the fluidextract was diluted with this stronger menstruum since it causes less precipitation than would diluted alcohol. In the other cases the difference between the menstruum for the fluidextract and that for the tincture is less marked, and clear tinctures are obtained by the use of the official tincture-menstruum for diluting.

Dry extractives were obtained by evaporating 5 cc. of the tincture in a small copper evaporating dish, having a capacity of about 10 cc. Evaporation was conducted on a sand-bath heated by a normal-pressure steam coil, and was continued over night, or 15 to 16 hours. Different pipettes were used each time, and the variations in these probably will account for the slight discrepancies which may be noted in the results.

It will be observed that changes in extractive usually correspond to precipitation, but not always. It is probable that in some instances oxidation occurs to an appreciable extent.

In the case of the standardized (alkaloidal) tinctures, and also with tinctures of *cannabis indica*, and squill, which were made from physiologically standardized fluidextracts, the extractives indicate only the physical condition of the tinctures at the beginning and end of the tests.

As a standard of the strength or value of a tincture the amount of extractive is only partially satisfactory, since the ratio of extractive to activity is not constant in any case. For those tinctures which cannot be assayed for active principle it affords the only test we have, in many instances. That it may be deceitful, however, is shown in the fact that of the two tinctures of capsicum, the one containing the less extractive is decidedly the more pungent, hence presumably the more active.

Of the 30 tinctures for which no better method of comparison was found, seventeen show the U. S. P. tincture to contain the larger proportion of extractive at the end of two years, six contain a smaller proportion, and seven are practically equal.

There is no suggestion in these results that certain classes of tinctures tend to run above or below normal when made from fluidextracts. For instance, of the resinous tinctures, Benzoin, Guaiac, Ammoniated Guaiac, Myrrh and Tolu are higher in the U. S. P. tinctures, while Benzoin Compound and Ginger are about equal and Asafoetida and Aloes and Myrrh are below. Of the cathartic tinctures the U. S. P. Aloes and Rhubarb are higher while Aloes and Myrrh is lower and Aromatic Rhubarb is about equal.

It will also be noticed that the U. S. P. tinctures tend to precipitate more than the others, and that at the end of a year the two tinctures are more nearly equal than when freshly made.

The alkaloidal tinctures disclose two unexpected changes, namely the loss in strength of the tinctures of Nux Vomica and of Hydrastis. The fluidextracts of these two drugs have been shown to be permanent, but the loss in strength of the tinctures is unmistakable. In each instance the U. S. P. tincture has lost more than the tincture made from the fluidextract, and the loss is greater during the second year, but each tincture has lost. The assays were repeated in each instance, so that these cannot be questioned. The U. S. P. tinctures have precipitated, but the others are so nearly clear that the loss in strength does not appear to be due to this cause.

The tinctures of Physostigma have also deteriorated, but this was more to be expected since the stability of Physostigma preparations has previously been questioned.

The U. S. P. tincture has lost half of its original strength and has precipitated some, while the other tincture has lost much less and remains clear.

The Cinchona tinctures have all lost in strength, and have also precipitated badly. It has previously been shown that precipitation in galenical preparations of Cinchona carries down some of the alkaloids, so this result was anticipated.

The other alkaloidal tinctures show no material loss in strength in two years.

With regard to color, tinctures made by the different methods in most instances show no more differences in color than would be expected from different lots of drugs. Where a difference is noted in the table, the difference is usually slight and would not be observed except by comparison. There are, however, five notable exceptions:—the tinctures of Belladonna, Hyoscyamus, Stramonium, Cannabis Indica and Physostigma can be easily distinguished as to source by color alone. In the first four, the U. S. P. preparations all have a brownish color with little or no tint of green, while the tinctures made from the fluidextracts are all bright green in color with no trace of red or brown. This cannot be accounted for by differences in menstruum, (unless possibly in the case of Belladonna) and it is not easy to understand. The U. S. P. tinctures when first made had a decidedly greenish color, but lost it on standing. Why the others did not change also is not understood.

Much less difference is observed in the two tinctures of Physostigma, yet even here there is a marked difference in tint.

In the other cases any difference observable is one of shade rather than of tint. The differences in the tinctures of Asafoetida, Calendula, Myrrh, Quillaja and (perhaps) Guitaia is marked enough so that they might be noticed by a patient, but in the rest of the cases a comparison is necessary.

As might be expected, precipitation most often occurs in the U. S. P. tinctures, and so far as could be judged by the eye, most of it occurred during the first year. However, the table shows that tinctures will often precipitate when the corresponding fluidextracts do not. This is in accordance with the general observation that concentrated solutions are usually more stable than dilute.

*Conclusions:* On the whole the tinctures made from fluidextracts compare very favorably with those made direct from the drugs. In the case of the standardized tinctures, the strength is necessarily the same, and the stability is fully as good, if not better.

The non-standardized tinctures leave more to the judgment because we have no definite standards for comparison, but it is probable that there is no more difference between those made by the two methods than there would be between different tinctures made by the same method with different lots of drugs.

One of the main purposes of this investigation was to ascertain if tinctures from fluidextracts are as stable as those made direct from the drugs. This question is answered satisfactorily. The results show a greater rather than a less stability.

LABORATORY OF PARKE, DAVIS & Co., Detroit, Mich.

#### ABSTRACT OF DISCUSSION.

Dr. Asher: I would like to ask Professor Scoville whether in diluting these tinctures the same menstruum was used, or if a menstruum was used equivalent to U. S. P. strength. What was the alcoholic strength of the menstruum employed?

Prof. Scoville: In the case of belladonna it was diluted with the same menstruum as the fluidextract. I cannot say definitely in every case, but in most cases the dilution was made with the menstruum for the tincture, but as a rule there is very little difference. The difference in menstrua of tinctures and fluidextracts is very much less than it used to be. They are getting to be more and more uniform. The next Pharmacopoeia will make them still more uniform.

Mr. Lackenbach: The dispensing pharmacist, particularly in the smaller communities, has always been timid about making tinctures from fluidextracts. He would do it almost invariably, but in an underhanded way, thinking it was not right to do so. In some cases it has been carried to extremes, for instance in the preparation of tincture of digitalis from the fluidextract. But according to Mr. Scoville's paper it would seem that the dispensing pharmacist is justified in using the fluidextracts, especially the standardized fluidextracts. I think that would be a great relief to the pharmacists, especially in the smaller communities, who do not have occasion to make large batches of tinctures, and the fluidextracts sent out by the large pharmaceutical houses are very convenient.

Dr. Turner: It may be stated that in the case of tinctures prepared from fluidextracts which contain alkaloids there should not be any difference. In making the fluidextracts the drug is exhausted, so it no longer contains any alkaloid. Tinctures prepared from these must be just as active as the ones which are prepared by percolation directly from the drug. It is interesting to note that Professor Hatcher in his paper read recently before the New York Branch of this Association, gave illustrations of tinctures made from drugs as well as fluidextracts wherein he showed that there was no variation in the products.

Mr. Lackenbach: I think there must be an exception in the case of digitalis because the alcoholic menstruum will remove the principles that are not desired in the diuretic effect of

the drug. It seems to me rather reprehensible to use fluidextract of digitalis in preparing a tincture.

Dr. Arny: Ten years ago if we had heard Professor Scoville make that statement in regard to tinctures, I would have been ready to fight him. Dr. Hatcher in his little book on *Materia Medica*, published ten years ago, stated that the infusion of digitalis from the fluid-extract was scarcely short of criminal, and he got up at the meeting of the New York Branch and stated that the physiological tests now showed that the two were identical. That being the case, I think we must revise our *Pharmacopoeia* as well as our *Materia Medica*.

Dr. Wulling: This discussion merely emphasizes the fact that we are not sufficiently qualified to determine the value of the drug unless we test it in more than one way, and the physiological test of drugs has compelled many of us to change our views.

## THE ESTIMATION OF MORPHINE IN PILLS AND TABLETS.

---

H. W. JONES.

---

The author reviews various methods proposed for extracting morphine with immiscible solvents. The method of estimation described depends on the conversion of morphine into diacetyl morphine and elimination of the diluents employed in making pills and tablets.

The assay of pills and tablets containing morphine or its salts presents certain difficulties because of the comparatively slight solubility of the alkaloid in any of the immiscible solvents ordinarily used. Of the simple solvents, amyl alcohol is the only one which dissolves morphine to any extent and this to so small a degree as to preclude its use where accurate results are desired. In case the morphine is present as a salt, it is always possible to estimate the acid radical but in the case of the sulphate at least, it has been the writer's experience that this procedure leads to high results.

Various compound solvents have been suggested, among which may be mentioned phenylethyl alcohol-benzol, methyl alcohol-benzol, methyl alcohol-chloroform, ethyl alcohol-chloroform and isobutyl alcohol-chloroform, all of which have been used with varying degrees of success. It is not the purpose of this paper to discuss the merits of these different solvents further than to mention that a mixture of one part alcohol and two parts chloroform by volume, as suggested by Williams<sup>1</sup>, has been used in this laboratory for the extraction of morphine with excellent results. We have modified slightly the method as described by Williams, using sodium bicarbonate instead of ammonia to liberate the alkaloid. By introducing this modification we have been able to obtain more concordant results, verifying the findings of Puckner.<sup>2</sup>

The object of this paper is to describe a method devised by me and which in my hands has given very good results. The principle of this method is the conversion of the morphine into an acetyl derivative, extraction with chloroform, and subsequent titration with standard acid. As morphine is most commonly used as the sulphate, this salt was used in the investigation. It was

---

\* Presented in Scientific Section A. Ph. A., San Francisco meeting.

<sup>1</sup> A paper presented at the meeting of the American Chemical Society, Washington, D. C., December, 1911. See *American Journal Pharmacy*, 86, 308.

<sup>2</sup> *Journal American Chemical Society*, 23 (1901), 470.

first necessary to determine the purity of the sample used, which was done as follows:

One gm. morphine sulphate treated with  $\text{BaCl}_2$  yielded 0.3129 gm.  $\text{BaSO}_4$  equivalent to 1.016 gm. morphine sulphate or 101.6 percent; 0.2 gm. morphine sulphate dissolved in water, made alkaline with  $\text{NaHCO}_3$  and extracted with 5 portions of alcohol-chloroform (1:2). After removing the solvent the residue consumed 5.31 cc.  $\text{N}/10 \text{ H}_2\text{SO}_4$  equivalent to 0.19989 gm. morphine sulphate or 99.99 percent. In order to determine if codeine was present in appreciable amounts, 1 gm. of the morphine sulphate was dissolved in water made alkaline with  $\text{KOH}$ , and extracted three times with chloroform. The chloroform, after filtering through  $\text{MgO}$  to remove traces of alkali, was distilled off and the residue on titrating consumed 0.25 cc.  $\text{N}/10 \text{ H}_2\text{SO}_4$  equivalent in 0.975 percent codeine sulphate. For the purpose of this investigation, the sample was therefore considered as 100 percent pure.

Not to burden the paper with a description of the various experiments made, suffice it to say that the following procedure was finally hit upon: 0.2 gm. morphine sulphate was placed in a clean, dry 120 cc. Erlenmeyer together with 0.1 gm. anhydrous sodium acetate and 3 cc. acetic anhydride. The flask was then fitted with a condensing tube and heated on a steam bath for one hour. The mixture was diluted with 25 cc. of water and the flask rotated until complete solution was effected. The liquid was then transferred to a separator, made slightly alkaline to litmus with ammonia, and extracted with 4 portions of chloroform, after which the chloroform was distilled from the combined extracts, the residue dissolved in 6 cc.  $\text{N}/10 \text{ H}_2\text{SO}_4$  and the excess acid titrated with  $\text{N}/100 \text{ KOH}$  using cochineal as indicator. By this method the following results were obtained:

1. 5.3 cc.  $\text{N}/10 \text{ H}_2\text{SO}_4$  consumed=0.1995 gm. Morphine Sulphate=99.7 percent.

2. 5.32 cc.  $\text{N}/10 \text{ H}_2\text{SO}_4$  consumed=0.2 gm. Morphine Sulphate=100 percent.

It will be understood that, although titrating acetyl morphine the factor to be used is that for morphine sulphate, i. e.,—

1 cc.  $\text{N}/10 \text{ Acid}$ =0.03764 gm. morphine sulphate.

As a further check on the accuracy of the method, a sample of morphine alkaloid, found by titration to be 100 percent pure, was treated in the same manner with the following results:

1. 0.15 gm. morphine taken required 4.99 cc.  $\text{N}/10 \text{ H}_2\text{SO}_4$ =0.1497 gm. morphine=99.8 percent.

2. 0.15 gm. morphine taken required 4.97 cc.  $\text{N}/10 \text{ H}_2\text{SO}_4$ =0.1491 gm. morphine=99.4 percent.

Having established in this manner that the conversion of the morphine into the acetyl derivative is quantitative, the method was then tried out on a number of pills and tablets to determine if it was applicable in a practical way. Here a new difficulty arose. Pills and tablets as a rule, contain considerable quantities of starch or milk sugar or both of these substances, and the action of acetic anhydride upon them produces acetyl starch or acetyl lactose, which compounds are soluble in chloroform and if carried through with the acetyl morphine, will obscure the end-point so that the titration becomes unreliable. To obviate this difficulty the following procedure was adopted.

Place a number of pills or tablets equivalent to 3 grains of morphine sulphate in a clean dry 120 cc. Erlenmeyer flask, add 0.1 gm. anhydrous sodium acetate and 4 cc. acetic anhydride. Fit the flask with a condensing tube and heat for one hour on a steam bath. (In the case of pills, coated or uncoated, it is usually necessary, after heating 10 or 15 minutes, to remove the condensing tube and with a stirring-rod disintegrate the pills, afterwards rinsing off the tip of the rod with a few drops of acetic anhydride and then continuing the heating for the balance of the hour.) Dilute the liquid in the flask with 25 cc. of water and rotate until solution seems to be effected. The acetyl compounds of starch or milk sugar being insoluble, will settle on the sides of the flask. Pour the solution into a separator and rinse the flask with two small portions of water, then with two portions of 15 cc. each of chloroform, and finally with two more portions of water, adding all these rinsing to the separator. (It is necessary to rinse the flask with chloroform in order to remove the acetyl starch or acetyl lactose which may hold some of the acetyl morphine.) Place a piece of litmus in the separator and add ammonia water until the liquid is slightly alkaline. Then shake for two minutes and when the liquids have separated, draw off the chloroform through a pledget of cotton into another separator. Repeat the extraction with chloroform three more times, drawing the chloroform extracts into the second separator. Then extract the combined chloroformic liquids with first, 20 cc 10 percent  $\text{H}_2\text{SO}_4$ ; second, 10 cc. 10 percent  $\text{H}_2\text{SO}_4$  and 10 cc. water, and finally with 5 cc. 10 percent  $\text{H}_2\text{SO}_4$  and 15 cc. water. Combine the aqueous extracts in another separator, make slightly alkaline with ammonia, and extract four times with chloroform. Draw the chloroformic extracts into a flask and distill off the chloroform on a steam bath. Dissolve the residue in 6 cc. N/10  $\text{H}_2\text{SO}_4$  and titrate the excess of acid with N/100 KOH using cochineal as indicator.

Below are given some of the results obtained by applying this method to pills and tablets of morphine sulphate:

Pill or Tablet.	Grains Morphine Sulph. by Acetylation.	Grains Morphine Sulph. by Alcohol-Chloroform.
G. C. Pill $\frac{1}{4}$ gr.....	0.239	0.24
G. C. Pill $\frac{1}{4}$ gr.....	0.241	0.246
G. C. Pill $\frac{1}{2}$ gr.....	0.498	0.49
G. C. Pill $\frac{1}{2}$ gr.....	0.397	0.4
T. T. $\frac{1}{4}$ gr.....	0.237	0.24
H. T. $\frac{1}{2}$ gr.....	0.511	0.519
H. T. $\frac{1}{4}$ gr.....	0.231	0.237
H. V. T. 1 gr.....	0.985	0.983

It will be seen that the method gives accurate results, and while it offers no particular advantages over the direct-extraction methods, I have found it useful as an alternative when a check assay is desired. A determination may be run in about two hours, and no troublesome emulsions are experienced. On the other hand, its field is limited, as it can be applied only to dry mixtures. The presence of moisture would of course inhibit the acetylation process.

## Editorial

E. G. EBERLE, Editor..... 63 Clinton Building, Columbus, Ohio

### THE NEW HOME OF THE JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

WHILE it will make little or no difference, practically, to our readers where the publication office of the Journal of the American Pharmaceutical Association is located, the subject was given careful consideration at the San Francisco meeting of the Association, resulting in instructions that the Committee on Publication decide the location and the committee was given power to act.

The question was discussed from every advantageous viewpoint for the Association and resolved itself largely into one of finance. The vote finally resulted unanimously for Philadelphia, the city around which, with its sister cities of the east, New York, Boston and Baltimore, the early history of the American Pharmaceutical Association is centered. Quite a number of other cities, in a helpful spirit, offered a home for the editorial office and throughout exhibited a desire to consider the interests of the Association paramount. The offices will be located in the rooms of the Philadelphia Drug Exchange, Bourse Building. While the change means more to the Editor than anyone else, for reasons that need not be cited, he cheerfully accepts the decision, because his expressed desire has been to be of service to the Association, believing that the interests of the organization deserve first consideration.

The prosperity and success of the Journal means much to the Association, and every member should contribute such assistance as he can render. First, enlarged membership strengthens the Association numerically and financially and insures more efficient and better service to pharmacy. Everyone can render assistance along these lines; there is hardly anyone who, if the desire is sufficiently strong, cannot secure at least one new member for the Association. This will also help the Journal.

There is another way that each member can exert an influence. The Journal only accepts advertising that can be endorsed. It is extremely doubtful that any other kind will ever be found in the Journal, but if this should occur, it is the duty of the members to advise the Committee on Publication, and they can be assured of prompt action. Therefore, your patronage of *your* patrons in the Journal should be forthcoming; you will have an opportunity, at least, of letting advertising patrons know of your appreciation of their business. Apprise them of the fact that you have read their message in the Journal. This much encouragement everyone can give. Some can persuade others to advertise and such assistance will be highly appreciated; and by contributing to the income of the Journal the expense of publication will be reduced—and it will make further improvement in the Journal possible.

Many schools of pharmacy patronize the pages of the Journal throughout the

year, others during a few months. The revenues and the possibilities of schools differ, and hence we have no desire to praise one above the other. This comment may be made, however, that the American Pharmaceutical Association is an ardent supporter of the schools, it has largely made them possible; at any rate, this organization is engaged in the same mission, namely, to elevate pharmacy, so that even if the returns from an advertisement amounted to little directly, there is an indirect value, traceable in many directions. We hope the coöperative spirit will become more evident. We are thankful to the schools that have favored the Journal and solicit the support of all the others.

After the minutes and papers of the several Sections of the Association have been printed, there will be need of contributions, and these are acceptable now. The Journal is desirous to coöperate with the Branches of the A. Ph. A. in every way and contributors of articles are invited to send in their papers as early as possible, and when discussions have brought out a valuable point these should accompany them. The Editor takes this opportunity of thanking the secretaries for their promptness and good reports. The situation has not been convenient, but when the Journal is located in its new home, there will be no cause for complaint, if such existed.

Finally, the Editor, and he doubtless can speak for the Association, desires to thank the members of the Association in Columbus, the Midland Publishing Company, Professor George B. Kauffman and Miss Anna G. Bagley for the helpfulness and courtesies, which they have always extended. While the Stone-man Press Company performed its duties under contract, it has throughout evidenced an active and commendable interest in the publication of the Journal.

E. G. E.

#### A DIFFERENCE OF OPINION STIMULATES PROGRESS.

A STAUNCH and loyal member of the American Pharmaceutical Association gave us the substance of a letter the other day, which he had received from another good friend, in which the latter apologized for differing in opinion with the former. The thoughtful answer of the former has prompted this brief editorial.

One of the greatest and most beneficent aids to progress in our Association and in every other activity, is the fact that we do not think alike about everything, provided of course, that discussion is not for contention or dispute alone, but prompted by a sincere purpose or conviction.

We should have definite opinions about things, and if they are of sufficient importance, or we truly believe them to be, then we should stand stout-heartedly by such opinions and bring them to a conclusion in real accomplishment. Many have brilliant thoughts, splendid plans, but if they are not fostered until they develop into serviceable results, they may be hurtful, rather than beneficial.

If nobody disagreed with us or everybody agreed with us, then we would soon become lethargic, or if so wonderfully adept, a superabundance of duties would be consigned to us. If a well-balanced, enthusiastic member does not think as another, who has made a conscientious study and analysis of the subject, then defects, if any, will be pointed out and thereby the proposition is

perfected or the conclusions proven to be sound and applicable for the intended purpose—both are helped by the discussion and the benefits will probably reach others or the Association in general.

Not only should we be thankful that everyone does not think as we do on all subjects, but we should encourage thorough investigation of plans and purposes intended for adoption by the Association or those now in operation. E. G. E.

### THE RETURN OF ALLIUM.

**M**ANY of those who participated in the revision of the Pharmacopœia and by their vote excluded quite a number of drugs, will doubtless wonder if not quite a few of these will be reinstated in the practice of medicine, now that the scarcity of some drugs has become very pronounced. A drug milling firm, in this business for many years, during the past month sold out their interests because the supply of drugs was too limited for profitable business.

Without specific references at hand, we are not in position to give historical data relative to the use of garlic as a remedial agent, at any rate as far back as 1600 the juice of garlic was employed to prevent and cure the suppuration of wounds, and its many other curative properties were extolled as far back as we have authentic records.

The Revision Committee of 1900, without a strong dissenting voice excluded the drug, but now the medical profession will have to give respectful attention to garlic, for its efficiency is vouched for by the London "Lancet" on the testimony of several eminent London physicians and the reports from the Paddington Infirmary in London, field hospitals in France and elsewhere.

The rediscovery is credited to a peasant woman of France, who cared for many wounded soldiers and with such remarkable results that her treatment was investigated by army surgeons and the discarded garlic has deservedly won its return to the materia medica.

An investigation is in order and perhaps the near relative, *Allium Cepa*, may possess medicinal virtues as much alike as the odor which strengthens their relationship. On the battlefields of Europe, many of the old household remedies are being largely employed, in most instances by compelling necessity. This much, however, may be said, that after the termination of the hostilities there will be many interesting reports from field hospitals, that will furnish abundant material for research.

E. G. E.

### IS PELLAGRA A SOCIAL OR MEDICAL PROBLEM?

**I**T IS not in our province to discuss diseases or even therapeutics, but if pellagra presents a social problem according to the conclusions of Dr. Goldberger, which have the indorsement of the Public Health Service, then a brief reference may not be out of place in these pages.

The Southern Medical Association met in Dallas last month, and the subject of pellagra was an important one. Not only were interesting papers dealing with the dreaded plague read before the Convention, but quite a number of unfortunates were present at the clinics held during the week in several of the

hospitals and at Baylor Medical College. Although the disease has been known in this country less than ten years, it has become one of the most industrious agents of death, especially in the South. While in other southern states pellagra is more prevalent, the number of cases in Texas is placed in the neighborhood of 35,000. It therefore deserves all the study that is being given to it, and in which we as citizens, if not otherwise, are interested.

Dr. Roberts of Atlanta, Ga., stated that it requires a very sanguine mind to say anything optimistic about pellagra and compared the futile attempts of medical men to acquire some knowledge as to what the disease really is and how to treat it, with the chasing of a rainbow by children. He believes that when the real cause is discovered, if ever, it would be found to be due to a parasite or a poison.

The parasite theory is studied by many and some of the records cited would point in that direction. The use of thymol and oil of chenopodium seems also to have been beneficial in some cases. The suggestion of a poison, as a cause, would not destroy the argument of Dr. Goldberger, whose studies and observations have convinced him that the disease is caused by an unbalanced diet, a diet lacking in proteids and that both prevention and cure are to be found in the balanced or varied diet.

Not all experience substantiates Dr. Goldberger's theory, but it is at least a very plausible one and comes nearer to being substantiated than any other hypothesis advanced.

E. G. E.

#### IMPORTANT HARRISON LAW DECISIONS.

**P**ROOF is no longer mandatory to establish the fact that the Harrison law has been instrumental in largely reducing the number of drug addicts. Therefore it would be unfortunate indeed, if the United States Supreme Court will hold the same opinion or apply the same construction to Section 8 of the Harrison law, as rendered by Judge Wilbur F. Booth of Minneapolis in the case against one Charles E. Jennin, and in effect holding him guiltless of unlawfully having in his possession some of the proscribed narcotic drugs, because he was neither a recognized dealer, agent or dispenser of the drugs in question.

Court opinions have little value until the final verdict is rendered by the highest tribunal. The argument on which the decision was based and rendered in the case referred to is surprising to those who are not familiar with the technicalities of the law. Such construction, as we view it, would imply that while persons required to be registered under the law may have unlawful possession of the inhibited drugs, those not required to be registered, and not registering, would be guiltless though they were in possession of large quantities of habit-forming drugs. In other words, it would penalize those who in every possible way discourage drug addiction and probably encourage a scheming class of venders, who for gain are willing to pander to one of the lamentable weaknesses of human nature. National legislators instead of strengthening the law by naming those who are legally authorized to deal in and dispense the prescribed drugs, if Judge Booth's conclusions are correct, have in reality though inadvertently prepared a

way for violating the intent of the law, without being guilty of punishable offense. Conditions would soon be worse under the law than they were before its passage.

Judge Booth is not alone in his opinion, for similar conclusions have been reached by other judges.

Another important Harrison law decision was recently rendered by Judge D. P. Dyer of St. Louis by sustaining a demurrer in a case against a physician, who was indicted for alleged violation of this law. Judge Dyer contends that the physician did not violate any law through writing prescriptions, because he did not personally dispense the drug. Also, the judge took the attitude that the Harrison anti-narcotic law is not of sufficient force to compel physicians to register prescriptions of narcotic drugs, because there are no penalties provided for failure to register.

Judicial tests are necessary to perfect the enactment and viewing the situation in this light, it may be for the best that these questions have been presented in court. It is hoped however that the importance of this measure in restricting drug addiction will prompt speedy legal progress, so that the Supreme Court may soon decide whether these opinions are well founded or not. If they are, then adequate amendments are imperative; if not, then a valuable and essential precedent will be established.

E. G. E.

#### CHRISTMAS GREETINGS.\*

Christmas is the day when the heart of man opens to joy and happiness. He, indeed, must be an incorrigible grouch or inveterate pessimist who cannot forget his own imagined misery at this time of universal rejoicing. From the old Germans or Scandinavians who celebrated the recurrence of the New Year after the shortest and darkest days had been passed, and made the evergreen hemlock of the North the emblem of the never-dying life of nature, this beautiful custom was taken over to the Christian era. Although pious priests substituted the birth of Christ for that of the revival of Spring, mankind never forgot the deep and thoughtful meaning of the day, and today, Christmas, in spite of its name, has long ceased to be a Christian festival alone. The green hemlock, with its gifts and glare, shines in every house, and its splendor brings happiness to young and old, to the infidel and the faithful, to all men without distinction of religion. For there is no other blessing so human and universal, so completely alike in the palace and the hovel, as the blessing of seeing others happy and contributing to their happiness. This desire to shed and spread happiness among our fellow creatures breaks forth in full beauty and clearness at this joyful time and nobody can resist its benign influence.

Let, then, this blissful feeling also enter our homes and open our hearts in the desire of giving and spreading happiness around us. We all need this change in our accustomed mode of thinking and acting. Let us, at this time of joy and blessing, forget the worries and troubles of business and cast aside the cares, most of which will suddenly appear imagined and unreal. There is much in life to be thankful for. Instead of trying to grasp and accumulate, let us give and distribute. Instead of hunting greedily for the glittering, deceptive

\* A message from the President of the American Pharmaceutical Association.

phantom of wealth and fortune, let us turn to others that need aid and happiness more than we do. Let us bring cheerfulness and content into our homes, among our friends; they have the nearest claim to our liberal hands and minds. Let us recall the beautiful days of our childhood, when happy expectancy made our hearts throb louder, and the brightness of our eyes and the flush of our cheeks betrayed our feelings.

And, brother pharmacists, at this happy, festive time, do not forget the best and noblest friend of all, the friend that has clung to us faithfully and lovingly through our whole life, to whom we owe all our success,—our profession. We all owe Pharmacy more than we admit, than we imagine. To the true and loyal disciples, Pharmacy stands forth like the common benefactor, the mother of our thoughts, our hopes, our ideals. Readily and amply she has strewn her gifts on us, encouraged our plans, strengthened our hopes, increased our energy for broader and nobler work. And more than others have we, the members of the American Pharmaceutical Association, received and accepted this blessing, and from year to year drawn new courage, new inspiration, new hope from her. Put, therefore, the name of this beloved benefactor, Pharmacy, on the list of those that you will make happy. Prepare a gift for her by devoting a small particle of your time, your thoughts, your earnings to her benefit. Tell your neighbor, your friend, of the many benefits you have derived from her; do not be afraid of talking in boastful words, in ideal descriptions; you cannot exaggerate. Keep on talking with the strength of conviction, the power of persuasion until you have enlisted him in our ranks. Thus, by gaining a new member, you may partly repay the blessings that Pharmacy has given you and present her with a graceful Christmas gift of your gratitude.

To many of my friends in the Association this Christmas appeal may appear childlike or too glowing, and they may smile at it. But I pray you, read it again at the night of the shining hemlock tree, when your home resounds with the clang and shout of Christmas happiness, when your heart is ready to forget the harshness and cold of the daily toil and is willing to join in the sweet, innocent happiness of your beloved ones. And if at that moment a spirit of thankfulness and gratitude to your dear friend Pharmacy creeps into your heart, keep it there, nourish it, and let it bear beautiful fruit, gratifying to yourself, blissful to your profession.

Unfortunately the numbers on and about the individuals did not come out distinctly in the reduction of the photograph. However, a sufficient number are distinct, so the names can be traced. The photograph was loaned by Mr. S. M. Scott, Jr., and the names were supplied by ex-President Caswell A. Mayo.

Members of the party on the "A. Ph. A. Special," while enjoying the hospitalities of Denver members of the American Pharmaceutical Association in the city situated "a mile high." Names on reverse side of this illustration.

## FREDERICK JOHN WULLING.\*

Frederick J. Wulling, President-elect of the American Pharmaceutical Association, is a native of Brooklyn, New York, where he was born in 1866. His father was an architect by profession. When he was four years old his father's family took up their permanent residence in what had been their summer home in Carlstadt, New Jersey, a suburb of the American metropolis, and there the son obtained his schooling in the grades, the high school and under private house tutors. He received business training in New York City during the last year at high school and during the succeeding year.

The young man's ambition pointed his way to college work and to a professional education. In 1884 he accepted a position with college privileges with Dr. C. W. Braeutigam, taking up the study of medicine, giving part of his time also to translating from German, French, Spanish and Italian technical journals. Soon he showed great proficiency in pharmacy, to which he subsequently gave most of his attention, and to such end that he had passed the senior examinations in pharmacy and its allied branches before the examining boards of New York and Brooklyn and of New Jersey when he was graduated from the New York College of Pharmacy in 1887. His leadership is indicated by the fact that he won by competitive examination a senior scholarship, and that he was graduated at the head of his class, receiving the gold medal and an analytical balance for supremacy, and from another source one hundred dollars in gold for high scholarship. Meanwhile, he had been attending lectures at the College of Physicians and Surgeons of Columbia University, though not as a regular matriculate. In addition to his scholarship honors the young student was also, for the last year of his course in the College of Pharmacy, a lecture assistant to Professor P. W. Bedford. In 1887 he was elected to a full instructorship, and the course of his life was definitely laid out.

In 1890 he was made assistant professor of pharmacy in the college from which he had been graduated, and the next year he was made professor of inorganic pharmaco-diagnosis in the Brooklyn College of Pharmacy, and he remained in this position until he was called to the deanship of the College of Pharmacy which he was to establish in the University of Minnesota. Meanwhile, he was becoming known in the universities of the Old World. Immediately after his graduation in 1887 he made a tour of Europe, visiting the principal seats of learning on the continent, among them, Munich, Berlin, Goettingen and Paris. Then he returned to America and took up further post-graduate work in the Hoagland Laboratory of Bacteriology with Doctor Lennox. Two years later, in 1889, he went again to Europe on a study and observation trip studying especially the methods of teaching chemistry in the leading German universities.

The name of Frederick J. Wulling will always be inseparably linked with that of the College of Pharmacy in the University of Minnesota for it was he who organized the college as a distinctive department in 1892, and from the beginning of the department was its dean. Before he was called by the Board of Regents of the University to that institution, Mr. Wulling was already widely known as an authority in his subjects, and was recognized as one of the foremost men of his profession as a student and devotee of research work. He has added immeasurably to that reputation since his connection with the University and has brought honors to his college. During the first five years of his connection with the University he received the degrees of Ph.D., LL.B. and LL.M. This in addition to the degree of Ph.C. He is well known abroad as well as at home, having again made tours of European university cities and research centers, notably those of Scotland, England, France, Belgium, Germany and Austria in 1893, 1896 and 1911.

In 1911 Dean Wulling was sent as a representative of the University of Minnesota to European seats of learning to study their botanical and medicinal gardens preparatory to establishing a similar garden at the University of Minnesota soon after.

His University title is "Dean of the Faculty, Professor of Pharmacology and Director of

---

\*The source of information for this sketch is a "Compendium of History and Biography of Minneapolis and Hennepin County, Minnesota."

the University Medicinal Plant Garden." He is also a member of the University Administrative Committee and of the University Senate.

He has been and is now a frequent contributor to scientific journals, and has published a great number of papers and essays as well as several large works, which include his "Evolution of Botany," his "Medical and Pharmaceutical Chemistry," his "Experiments for Beginners," his "Chemistry of the Carbon Compounds," and other technical works of his profession, with a "Course in Law for Pharmacists."

Dean Wulling is a member of a number of scientific societies, in which he is known as a prosecutor of much original research work. He has been president of the Northwestern Branch of the American Pharmaceutical Association; he is chairman of the Scientific Section of the Minnesota State Pharmaceutical Association since 1904 to date; he has been an executive officer of the American Conference of Pharmaceutical Faculties and in 1914 to 1915 was its president. In addition he has taken an active part in the work of the executive officers of the University of Minnesota; fellow American Association for the Advancement of Science; member of the American Pharmaceutical Association, of the American Conference of Pharmaceutical Faculties, University Club and Campus Club; vice president of the Minnesota Academy of Sciences since 1909 to date; honorary member of the Phi Delta Chi, and one of the Board of Directors of the Minneapolis Society of Fine Arts from 1902 to 1911.

In 1897 Dr. Wulling was married to Miss Lucile Truth Gissel, of Brooklyn, New York. A son, Emerson G., was born in 1903.

#### DETERMINATION OF ACETONE IN URINE.

After the addition of some drops of hydrochloric acid, 200-250 mls of urine are distilled into a 50-mil flask. To the distillate are added potassium hydroxide and a solution of iodine in potassium iodide. The iodoform is collected on a filter, washed carefully, and boiled with fuming nitric acid and some crystals of silver nitrate in a flask with a cooler. The liquid is diluted with water and filtered. The silver iodide is dissolved in dilute ammonia and reprecipitated with nitric acid, filtered, and washed. The precipitate is brought into a crucible, the filter washed in a platinum spiral, and the ash added to the silver iodide. Some drops of nitric acid are added, and material glowed carefully. By multiplying the quantity of silver iodide by 0.1171 the quantity of acetone can be found—(*Pharm. Zth.: through Pharmaceutival Journal.*)

## Section on Practical Pharmacy and Dispensing

Papers Presented at the Sixty-Third Annual Convention

### THE MISCIBILITY OF ICHTHYOL.\*

JEANNOT HOSTMANN.

Several months ago a prescription, calling for ichthyol, tincture of iodine, olive oil, acacia, and water, was sent to the "query editor" of one of the pharmaceutical journals, accompanied by a request for information as to its compounding. The writer was asked to try it out, and found that a passable "shake mixture" resulted when the ichthyol was triturated with the oil, followed by emulsification *ad lege artis*.

In replying to the querist the word "dissolve" instead of "mix" was inadvertently used. A correspondent called attention to the fact that ichthyol was not soluble in oil and the editor replied that "mixing" was meant and not "dissolving."

The correspondent replied, claiming that ichthyol was "neither soluble nor miscible with oils" and sent along a sample consisting of one part of ichthyol and two parts of cottonseed oil. The appearance of this apparently bore out his statement.

The writer remembered having somewhere seen the statement that "ichthyol was miscible with oils" and examination of the label on the jar of ichthyol in stock found that it read as follows:

"Ichthyol is soluble in water, or in a mixture of equal parts of water, alcohol, and ether; partially in pure alcohol or ether, miscible with glycerin or oils."

Turning to the "New and Nonofficial Remedies" published by the Council on Pharmacy and Chemistry of the American Medical Association, 1912, 1913, 1914, and 1915, we find the same statement; the "Extra Pharmacopœia" and other reference books also contain the same or a similar statement.

Every pharmacist knows that we rarely come across a substance that is miscible alike with water and oil, yet this statement quoted above has been made for years and apparently without contradiction. I have been unable to find a similar statement in the "Real Encyklopædia" or "Hager's Pharmaceutische Praxis."

Thinking it of enough interest to dispensing pharmacists to merit a little investigation, the samples contained in the two bottles, marked respectively ichthyol and olive oil, and ichthyol and cottonseed oil, were made by triturating the two in a mortar. Their appearance shows that they are not miscible. At first, before separation and adhesion to the sides of the bottle took place, partial suspension

\*Read before the Section on Practical Pharmacy and Dispensing A. Ph. A., San Francisco meeting.

seemed to have been brought about, but close observation showed that the ichthyol was present in the form of small globules almost similar in appearance to the globules formed when an oil is violently shaken with water. Complete separation took place very rapidly.

Thinking that different oils might act differently, the accompanying set of "mixtures" was made, using 4 gm. of ichthyol and 16 gm. of each of the various oils. The samples marked 1, 2, 3, etc., were prepared by first weighing the oil into a tared bottle, followed by the ichthyol and then shaking.

The following oils were used: No. 1, olive; No. 2, sesame; No. 3, expressed oil of almonds; No. 4, cottonseed; No. 5, corn; No. 6, lard oil; No. 7, linseed; No. 8, castor. The results with all were more or less alike. It was impossible to mix any of the samples. Noticing, however, that they all acted somewhat different from those made some weeks past, and recalling that the latter ones had been made by trituration, duplicates were made. The samples marked "1a," "2a," etc., were made by weighing the ichthyol into the mortar and gradually adding the oil with constant trituration. Results were practically the same as when the oil and ichthyol were weighed into the bottle and shaken; if anything, the latter were more "miscible," or rather more easily "miscible" than when the mortar was used.

The fact that the separated ichthyol appeared to be more mobile in the recently prepared samples than in the two older ones, led to a comparison of the two samples of ichthyol employed. The sample used in making up the two older samples had been in stock for about one year. It had been kept on the shelf in the well-known glass jar with tin cover in which the article is supplied to the trade. In comparing it with the newer and larger sample, just received from the agent and contained in a glass bottle, it was found that the older sample had apparently lost some moisture due to evaporation, as it was much thicker. Upon heating at 100 degrees to approximately constant weight the loss of the older sample amounted to 35.9 percent, whereas that of the newer was 41.8 percent.

The difference in water content might account for the difference in behavior. Not enough of the older sample being available, this could not be determined. Another rather striking difference is, however, noticeable. The supernatant layers of oil in the older samples practically have their original color. All of the second set are more or less darkened. Apparently a small amount of the ichthyol has gone into solution. This must mean, that either in the old sample of ichthyol other changes than simply loss of water have taken place, or that the ichthyol on the market today is different in some respects from that of a year ago.

While it might be interesting to enumerate the slight differences in behavior as to this discoloration as well as to that of the separated ichthyol in the different samples, I do not think it important enough to discuss same in detail. Comparison of the samples will speak louder than words.

Ichthyol is a proprietary article. The Council on Pharmacy and Chemistry of the American Medical Association issues the New and Nonofficial Remedies as a guide to physicians in prescribing these so-called "newer remedies." I therefore feel that such a statement as quoted above is misleading and might easily lead to serious misunderstanding between physician and pharmacist as well as to loss and suffering to the patient.

Ichthyol is *not* miscible with oils and a physician writing for a mixture of ichthyol and oil would obtain an entirely different product from what he had been led to expect by the statement appearing in the "N. N. R.," as well as on the label of the ichthyol containers and the literature put out by the manufacturer thereof.

COLUMBIA UNIVERSITY COLLEGE OF PHARMACY, August, 1915.

---

## ARRANGEMENT OF THE PRESCRIPTION DEPARTMENT.\*

---

H. W. WEED, NEW YORK.

---

The modern druggist is as far away from the "mysterious" in regard to the conduct of his prescription department as he is far away and different in his method of store merchandising when compared to the apothecary shop or drug store of ten or fifteen years ago. Therefore it is not to be wondered at that improvement in arrangement, fixturing and equipment in the modern prescription room has undergone many changes to keep pace with the demands of the progressive merchant.

The object of this paper is to suggest to the members of the American Pharmaceutical Association who are contemplating changes in their prescription department a few suggestions which seem to the writer worthy of consideration.

First, let us think for a moment of the actual needs of the smaller merchant, the store doing in the neighborhood of \$25,000.00 a year. These stores to make money necessarily have to be clerked with economy; hence the proprietor generally alternates with his one prescription or head clerk, as he is generally termed. To remove the prescription department in such instances to the back part of the store across the back or in either corner is bad for service and should not be done. If any reader's store is thus arranged, I would suggest you change at your earliest convenience to a position of the drug counter which should be located not more than half way back in the store, and so constructed that the prescriptionist could have a good view of the store. This statement will shock some of the straight-laced ethicals, whose "Safety First" ideas call for isolation, concentration, uninterrupted, etc., all necessary factors to be insisted upon in the conduct of large departments employing many men whose total daily output of prescriptions compounded will reach or exceed two hundred and fifty. There, such discipline is necessary. Please do not misunderstand me. I am not belittling dignity or safety, but we are considering the one man proposition in the smaller town or the neighborhood druggist, who, because of the smallness of his business, is obliged to be general clerk as well as prescriptionist; hence the necessity of constructing, arranging and locating this department so it will fit into the merchandising scheme in such a way that the proprietor or head clerk has general supervision of the whole store at all times. The result of this arrangement will be satisfied customers, increased business and a competence worthy the calling, because the mas-

---

\*Read before Section on Practical Pharmacy and Dispensing, A. Ph. A., San Francisco meeting.

ter hand and mind is in the midst of things and not separated by an unwise choosing of location for this department.

The amount of space required would be 4 ft. long by 18 in. deep and 6 ft. high, running lengthwise of the store and should be a part of the drug counter, which is, as you know, a fixture 30 in. wide by 36 in. high. This would give plenty of room in front of the upright for display purposes. I am opposed to zinc covering for the work board, glass is always preferable, and this  $\frac{1}{4}$  to  $\frac{3}{8}$  plate. The arrangement of drawers, width of shelves, etc., should be carefully thought out by the owner, avoiding always big drawers, as they invite untidiness and waste of room. In one corner of the work board should be a very small sink about 6 by 9 inches, fitted with gooseneck faucets for hot and cold water. The majority of my readers may think these dimensions too small, but can you wisely devote more space?

As stock turnover is also necessary to success, I counsel the purchase of drugs in small quantities. Therefore, in ordering prescription ware, I would not buy any salt mouth bottles larger than four-ounce and only a limited number of them.

The care and filing of prescriptions might just as well be considered here, for the following plan is the best and most applicable for all prescription departments, regardless of size and number compounded. This method enables immediate reference to any number desired, takes up little space, as you will see. The arrangement is to have cardboard boxes made  $4\frac{3}{8}$  wide by  $6\frac{1}{2}$  long by  $2\frac{1}{8}$  deep outside measurements, not including covers. Procure some thin bookboard, have same cut  $6\frac{1}{8}$  long by  $3\frac{1}{8}$  wide, have a small hole punched in these cut pieces in the center about half an inch from one end. A pair of these bookboards will form the top and bottom of the prescription file, the scheme being to place one hundred prescriptions between the covers, bind them loosely with a single string which will make a sort of loose leaf arrangement, with one hundred prescriptions to a book and five books to the box, and two boxes deep on a shelf. By this method you will have in time a perfect metric system of filing; every two boxes containing one thousand prescriptions. The writer saw a cabinet of twenty thousand prescriptions filed in this way and was amazed at the small space occupied by so many prescriptions and the ease with which any number could be selected. The shelf arrangement should be built to accommodate but ten boxes wide and two boxes deep. Therefore, the first shelf would hold prescriptions numbering from one to one thousand; second shelf one-thousand-one to two thousand; thus a cabinet with ten shelves would accommodate one hundred thousand prescriptions. The system of numbering and pricing is, numbers always in the lower left-hand corner, prices in lower right-hand corner.

Where the business of a store warrants the steady employment of two or more prescriptionists who give their entire time to manufacturing and prescription work, the location of the department may be in a space least valuable for merchandising purposes, preferably in a space next adjoining the rubber goods or sick room supply department, for the reason that the prescription department is the natural and almost exclusive feeder to this allied department, and if this department is merchandised properly and properly clerked, the business of this department will grow and become the most profitable part of your whole store.

Have you ever stopped to think, when a prescription is brought into your store, it should be thought of as a certificate of information signed by the doctor, conveying to you the knowledge that there is sickness in the home of the bearer, and, where sickness is, there is every possibility that many sick-room supplies may be required, and the very opportunity you are seeking is at hand? Perhaps you can tell by the medicine prescribed somewhat the nature of the sickness in the home. If not, a few simple inquiries will give you the idea of what to suggest in the way of sick-room supplies. The present method of handling prescriptions is all wrong, according to the writer's notion of merchandising. Did you ever know of a perfectly well person wanting a pair of crutches or a bed back-rest or a bed-pan, a sick-feeder, or a gruel tube? You have probably said a great many times when handing out a prescription after filling it, "Who is sick up at the house?" You have been told by the mother or father, or James or John, or whoever brought in the prescription, and the only comment made is, "I am sorry; tell them I inquired after them; hope they will not be confined to the house long." Where, if you applied the art of salesmanship, it would be the most natural thing in the world to say, "When father gets so he can sit up, you better come down and get him a back-rest or an invalid's wheel chair, so that he can begin to get a little exercise and sunshine." Just that moment you begin to bring the prescription department into closer relationship with your rubber goods and sick-room department. Just that moment you will begin to get enthusiastic over this suggestion the writer is making and by giving it some thought and by letting your imagination work along these same lines, you will see what's in the writer's mind when he urges upon you to link these two departments together.

Labels and copies of all prescriptions should be typewritten.

No person other than the man on the job can lay out a suitable or workable floor and fixture plan without careful data as to size and shape of store, together with an estimate as to the amount of business expected to be done, the population of the town, also whether the M. D.'s are prescription writers or dispensers. However the experience of others is valuable and a suggestion from this one, an idea from another helps a fellow solve the problem of the best for his particular store. So it is with the hope this brief article will help some brother to better things, as it surely will if some of the suggestions are adopted, for they are not experiments, but the result of experience.

#### ABSTRACT OF DISCUSSIONS AND REMARKS.

Chairman Osseward: I saw in one of the papers that Mr. Liggett had made an address before the Philadelphia branch of the American Pharmaceutical Association on "Modern Merchandising," and the paper appealed to me. So I got the idea of writing Mr. Liggett and asking him to prepare a paper. I thought it might bring out the point that he would have some of his men give us a paper. Mr. Liggett told me as he was not a practicing pharmacist, but a merchandiser, that he could not comply with my request. I then wrote Mr. Liggett and asked him if he would not have one of his men give us a paper, and this is the result.

There are several points in it that are valuable, it seems to me. The idea of placing the prescription department in the center of the store was a new thought. Of course, he is speaking of a small store now; this does not mean a large store. It does not mean those who have a good prescription business. He suggests making the prescription department more prominent, placing it where you can watch both ends of the store, especially where there is only one man in the store most of the time. These are very valuable suggestions.

Dr. Weinstein: I do not see what I could learn from this. This is the arrangement in most of the stores. The difference is that most of the stores do not do \$2,000 a month. There are stores in New York that do \$2,000 a month or say \$25,000 a year, but most of the stores would be happy if they could do so.

Mr. G. H. P. Lichthardt: It seems to me that the valuable part of that paper is the suggestion as to salesmanship. It is brought out very forcibly. I never realized when Jimmy came in with a prescription for an old gentleman with the rheumatism that possibly he might want a water bag. I know that I could not hold a job in a chain store because I could not do that. I would get fired the next week. But that is evidently the great point in that paper, to my mind.

Mr. F. W. Nitardy: The way that paper is written, you can see that it is by a man that considers dollars and cents in the drug business. He is a merchant and he is a business man, and his eyes are open for getting the dollars. We have got to do that, even though we like to be technical pharmacists.

I have been told lots of times that I am not a business man at all; that I am a scientific man. I do not lay any claim to that; I try to be a business man; that is the way I make a living.

I think there is a lesson in that paper. I don't agree with Dr. Weinstein that he cannot see anything new in the paper. I think it sets us a good example. I greatly appreciate the idea of Mr. Liggett.

---

### MAGNESIUM CHLORIDE TO STIMULATE CYTOPHYLAXIS.

The property possessed by living cells of protecting themselves from infection is named by the author cytophylaxis. The favorable action of the majority of antiseptics used is due not so much to their killing the harmful micro-organisms, but to their allowing the process of cytophylaxis to proceed. This is mainly due to the action of phagocytes. Unfortunately, the majority of those antiseptics which kill the harmful germs, at the same time destroy, or hinder, phagocytosis. Even in the most favorable cases the number of phagocytes is reduced by 80 per cent. This explains the lamentable number of failures which follows the use of antiseptics when applied to infected wounds. The problem of killing the microbes without injuring the living cells has not yet been solved; but many antiseptics are known which destroy the cells without with certainty destroying the microbes with which they are mingled. The author has therefore experimented with a number of non-antiseptic solutions which stimulate phagocytosis. Of these magnesium chloride, in the proportion of 12.1 per 1,000 is one. This solution increases phagocytosis 75 per cent. compared with physiological salt solution, and the latter is 63 per cent. more active than Ringer-Locke's serum. The augmentation is observed not only in the number of active polynuclear phagocytes, but also on the individual phagocytic power of each cell. The solution retains its cytophylactic power when administered by injection into the circulation. It may advantageously be employed in this manner as well as applied locally in the form of dressing.—*P. Delbert and Karajanopoulo (competes rend., 1915, 161, 268), through Pharmaceutical Journal.*

## Contributed and Selected

### A REVIEW OF PHARMACEUTICAL LITERATURE.\*

JOHN K. THUM.

It may be of interest to pharmacists to know that not only are some of the better class of newspapers showing a growing disinclination to advertise patent medicines, but they are also beginning to discuss the proprietary evil. The *New York Sun* reported an address delivered by Prof. Francis Carter Wood before the alumni of the College of Physicians and Surgeons, and in its editorial columns commented quite freely thereon. The gist of the *Sun's* editorial is a warning to the public to shun the proprietary-prescribing physician.

It impresses in unmistakable language the possibilities of harm to the patient in the acceptance of prescriptions from medical men who are too indolent or unscientific to think out and write their own prescriptions; who know nothing of the composition of what they prescribe except what the proprietor chooses to tell them, and who certainly have not the time nor the knowledge to find out if the manufacturer is telling the truth. It goes on to say that we "trust the doctor because we know him and that this trust is misplaced if he prescribes a drug the composition of which he does not know."

That the newspapers could be of considerable influence in correcting this evil goes without saying, but their interest must become more general.—Editorial, *New York Sun*, October 7, 1915.

*The Assay of Balsam of Peru*:—The authors of this paper state that for the assay of this balsam, a number of tests have been proposed, and are to be found in the various pharmacopœias and similar publications; that those depending on color reactions are usually unreliable and of limited value. Much stress is laid on the acid value, saponification value, cinnamein content and its saponification value; that the determination of these constants is generally required by the best authorities and yet it is obvious, they add, that such values are far from being absolutely characteristic, that they are insufficient to demonstrate the purity or authenticity of a sample is a fact unpleasantly brought to their attention by the appearance in recent years of imitation or "synthetic" balsams almost indistinguishable from the natural product.

In a thorough examination of balsam of Peru made by Thoms there was isolated, among other things, a new alcohol, peruvicol. This compound, a light liquid with a characteristic odor, was subsequently found to be identical with nerolidol, the sesquiterpene alcohol isolated by Hesse and Zeitschel from the high-boiling fractions of oil of orange flowers.

The authors believe that peruvicol, with its high iodine value and dextro-rotation, is the most characteristic constituent of the balsam, and they advise the following simple method for isolating it:—

**Peruvicol Test:** 20 grams of balsam are saponified by heating one hour on a water-bath, with frequent shaking, in a liter flask, with 20 grams of 25 percent potassium hydroxide. Steam is then passed through the mixture, and the distillate collected in 100 or 150 cc. flasks with narrow, graduated necks. From natural balsams there is obtained in this

\*Read before Philadelphia Branch, A. Ph. A., Nov. 9, 1915.

manner, in 300 cc. total distillate, from 0.7 to 0.9 cc. of light oil. Imitation balsam gives only traces of heavy oil.—By Francis D. Dodge and Alfred E. Sherndal, *Journal A. Ph. A.*, October, 1915, page 1222.

*Quizzes, Tests and Examinations*.—Repeated arguments against final examinations as a means of judging the ability of a student have failed to convince the writer of this paper that the time is ripe for their abolishment. They are the best incentive a student has to stimulate his interest and make him strive to do his best. But that best should not be postponed until just a few weeks before final examination. There should be consistent daily application on the part of the student. "There is no short road to success." There never was and never will be! The author's experience in teaching has convinced him that the most practical method of making students study all during their college course is to put quiz work on the basis of frequent written tests.—By H. V. Arny, *Journal A. Ph. A.*, October, 1915, page 1233.

*New and Non-official Remedies*.—The Council on Pharmacy and Chemistry of the A. M. A. have accepted histamine hydrochloride, the hydrochloride of the base beta-iminazolylethylamine (histamine). Histamine is closely related to histidine, from which it differs in that one molecule of carbon dioxide has been eliminated. Histamine hydrochloride has a powerful contractile action on certain muscular fibers and a strong vasoconstrictor action. The available evidence does not warrant a recommendation for its therapeutic use, but it is a valuable reagent for the standardization of pituitary and similar preparations.

Mercurialized Serum has also been accepted by the same body. It is a solution of mercuric chloride in normal horse serum, diluted with physiologic sodium chloride solution. It is claimed to be of value in the treatment of syphilis, particularly of the cerebrospinal type. It may be given intravenously or intraspinally.—*Journal of A. M. A.*, October, 1915, pages 1367, 1185.

*The so-called Concentrated Solution of Silver Iodide*.—The writer of this paper states that there is on the market at the present time a so-called soluble preparation of silver iodide. That is to say, the silver iodide is in concentration in the form of a solution and the addition of this solution to a designated volume of water makes a 5 percent suspension of silver iodide. Whether this method of dispensing silver iodide possesses any advantages over the usual method is questionable. In the writer's opinion it would be far safer for a patient to receive a freshly prepared precipitate of this chemical, well washed, and held in suspension with the aid of a solution of gelatine, Irish moss, or some other appropriate gummy substance.

This solution of silver iodide is made by taking advantage of the fact that silver iodide is soluble in an excess of potassium iodide.

One of the claims made by the manufacturers of this preparation is that "it is less expensive" than preparations of the same salt sufficiently diluted for immediate use. When one considers that the solution of this salt requires a considerable excess of potassium iodide (the preparation on the market showing on analysis at least 60 percent of free potassium iodide), and then considers the price of potassium iodide even in normal times, one is averse to agreeing with this statement.

It is also well to remember that potassium iodide as found on the market is usually quite alkaline and while it may be true that such a preparation is painless when introduced into the urethra, that does not prove that it is harmless. It is also well to remember that suspensions of silver iodide are frequently used in eye infections, and for that purpose should be very carefully prepared, the silver iodide first being very carefully and thoroughly washed with sterile distilled water. If this technic is not followed, the application of the preparation to an eye condition will result in much irritation, pain and an inflammatory condition that is difficult to control.

The writer's investigation of this preparation revealed that it can be prepared readily according to the following formula:—

Silver nitrate	3.70
Potassium iodide	17.00
Distilled water to	25.00

This volume of 25 mls solution, when added to 75 mls of distilled water, makes a 5 percent suspension of silver iodide.—By John K. Thum, *American Journal of Pharmacy*, November, 1915.

*Detection of Arachis Oil in Olive Oil*.—Arachis oil, more generally known as peanut or ground-nut oil, is quite frequently used to sophisticate olive oil. The following method for its detection is suggested: One mil of the suspected oil is heated with 5 mls of an 8 percent alcoholic caustic potash solution for four minutes in a flask provided with a condensing tube. After cooling to 25°, 1.5 mls of a mixture of one volume of glacial acetic acid and two volumes of water are added, followed by 50 mls of 70 percent alcohol. If the solution is turbid, it is carefully heated until perfectly limpid, is then cooled gradually and the temperature at which it becomes turbid is noted. Pure olive oil becomes turbid at 13.5°, that containing 5 percent arachis oil becomes turbid at 16.9°; that containing 10 percent becomes turbid at 19.8°, and so on. The higher the percentage of arachis oil present the higher the temperature at which the suspected oil becomes turbid.—*The Druggists Circular*, October, 1915, page 665.

### THE MERITS OF PHARMACY.\*

---

WILLIAM C. ALPERS.

---

In timid and hesitating mood, pharmacy steps into the circle of the older and more venerable professions, doubtful of cordial reception. Will they welcome her as a legal sister, or will they turn on her as an intruder? It is not much more than a generation that pharmacy has laid claim to full recognition, at least in the United States, and there is still much opposition to this claim. It is said that she lacks the dignity of a science, and is tainted with commercial desires and tendencies. She possesses neither the venerable age of philosophy, nor the majesty of law, neither the sacredness of theology, the benign power of medicine, nor the depth of natural science. She may be an art, an accomplishment, a skill, but no science.

Whosoever looks upon pharmacy in this way knows but little of her merits, and judges superficially. It is true she does not surround her work with outer glare and glitter. In her daily practice we look in vain for the pomp of judicial display, or the incense and music of sacred worship; nor is there the mysterious dignity of medicine. In a modest, quiet way she stands back and performs her duties without ostentation. Other sciences and professions have gone the same thorny path before they found full recognition. It is nearly one hundred years ago,—in 1824,—that a young pharmacist, Justus Liebig, was appointed the first professor of chemistry at a German University. Raised as a pharmacist in his city, and extending his knowledge of chemistry in Paris, under Gay Lussac and Humboldt, he recognized the possibilities of his vocation, and his master mind conceived ideas and inventions that created not only a new science, but also a new industry. The older professors of Giessen looked upon him with ridicule and disdain. Chemistry might be a toy for scientific men,—a science, never! But the young pharmacist, only twenty-one years old, worked patiently along, and before his death he had become a giant among his peers and a benefactor of the whole world.

---

\* Address delivered at a convocation of the Deans of Western Reserve University, Cleveland, O., before the faculties, members, students and friends of the University.

Where chemistry stood then, pharmacy stands today. Chemistry has since performed wonders, but her great achievements were not due to theoretical deductions and philosophical arguments alone. The chemical thinkers, following Liebig's example understood how to apply the results of their minds to practical purposes, to the needs and demands of daily life, and thereby make them popular. It is in this adaptation that the strength and influence of all science lies today. The times of abstract thought and mere philosophical arguing have gone. The sage of the middle ages who pondered quietly in his study and built up around himself a new and beautiful world of mental ideals, has passed away. His writings, understood only by a few, are still the pride of scientific libraries, but their mystic pages are no source of inspiration or power. Knowledge has long ceased to be the mysterious possession of a few, who were looked upon with awe by the wondering crowds. Knowledge, today, is the property of all; it is demanded and given like air or water, common and accessible to everybody. In this general distribution of useful knowledge lies the duty and the power of a university. It is not erudite discourses and essays, however deep and beautiful they may be, that make a school of learning great; it is the ability to use knowledge and science for the benefit of all mankind; to come forth among the people like the distributor of blissful gifts, and spread blessing and happiness among the sick and ignorant.

If these premises are correct, if this conception of the mission of a university is true, pharmacy may safely step forward and claim full recognition. Her teachings are not in the abstract, her doctrines are not those of speculation and theory, her work is not for the few select, but for all, the highest as well as the humblest. She does not stalk about on stilts, nor does she soar to heights unapproachable to the masses. She walks in common garb in the streets and highways, carrying small and humble gifts, that she willingly distributes among the sick and needy. She talks in common words, ennobled only by looks of mercy and depth of feeling. It is not by grandiloquent phrases, but by quiet and effective deeds that she accomplishes her daily task. Relieving the sufferer, healing the sick, soothing the afflicted, are her watchwords, and her days are spent in spreading health and blessing.

This humble work, however, is not done without mental strain and the efforts of thinking minds. In pharmaceutical laboratories all over the world thousands of experiments and assays are daily performed to discover new chemicals, new qualities of minerals and plants, new combinations of older medicaments. A special branch of chemistry has grown up,—pharmaceutical chemistry,—with its own laboratories and apparatus. Such chemical works of enormous size are erected in all civilized countries, and their products, in the form of new remedies, go forth to the pharmacists and from them to the patients. In the schools of pharmacy, assays of plants, microscopic examination of their parts, research in pharmacognosy is the daily work; weeds and herbs, trees with their roots and bark, that nobody noticed nor cared for, are drawn into this sphere, and wonderful properties, formerly unknown, are discovered. As an example, let me mention the well known *Cascara Sagrada*, the bark of a certain buckthorn, the preparations of which in the shape of fluidextract, pill or tablet, have worked infinite good to suffering mankind. Before the time of pharma-

ceutical research, this plant grew abundantly, as now, in California, but was an unknown shrub that nobody cared for; now, it is a blessing to mankind. And, not satisfied with examining indigenous plants, pharmacy has reached out to other continents, and by her efforts to bring their plants nearer, created a new field for the agriculturist. In the hills of Kentucky, ginseng and hydrastis are now cultivated. Wisconsin and Minnesota produce tons of cultivated mint and other labiates; belladonna and digitalis are now raised on large tracts in California; the fragrant camphor tree, of whose production Japan formerly had a monopoly worth millions, now grows in the swamps of Florida. Daily new medicinal plants are drawn into this scope, and our country with its manifold climates and soil, will soon be independent of the botanical products of Europe, Africa and Asia. Thousands of men are thus employed in the service of pharmacy, from the professor in the schools and the chemist in the pharmaceutical works, to the laborer in factory and field. Here, then, is a profession whose efforts and teachings go back to the people in double blessing,—as a producer of work for thousands and as a reliever of pain and sickness.

The homes of pharmaceutical schools are in most cases small and modest. As a rule, they are private enterprises, supported solely by the tuition of the students. In some of the western states, where the value and merits of pharmacy have been better recognized than in the east, state universities have regularly acknowledged pharmaceutical faculties and the schools are admirably equipped. The students there are on a par with all other students, entering the school with the same preliminary education as those of other professions. In the east and middle west, much remains to be done. Philanthropists have, so far, overlooked pharmacy. With one exception, there was no endowment of any size ever given to schools of pharmacy. Many men have become immensely rich through the products that the humble pharmacists all over the country have sold; but while they give liberally to medicine, law and science, no one ever thinks of pharmacy. This is particularly regrettable in Ohio, Pennsylvania and neighboring states, the states of oil and coal. The pharmaceutical products gained from these two sources are very numerous, and have earned millions for the manufacturers. Would it not be a gracious acknowledgment of the help that the pharmacists have given these wealthy men to endow pharmacy in a suitable manner?

Meanwhile, we pharmacists perform our quiet and humble task. Undaunted by the many difficulties that beset our profession, we continue to do our work in the interest of humanity and civilization, aiding the weak and afflicted, extending the scope of our usefulness and adding our share to that noblest aim of all knowledge and science, the betterment and uplifting of mankind.

THE AIMS AND PURPOSES OF THE AMERICAN  
PHARMACEUTICAL ASSOCIATION.\*

CASWELL A. MAYO.

A meeting of the Philadelphia College of Pharmacy, the Massachusetts College of Pharmacy and the New York College of Pharmacy, was held at the New York College of Pharmacy in 1851 to discuss the problem of improving the condition of the drug market, and preventing the importation into the United States of drugs and chemicals of inferior quality. As an outcome of this conference, a call was issued by the representatives of the three colleges for a meeting to be held at the Philadelphia College of Pharmacy in 1852, with a view to carrying still further the objects aimed at in the conference of colleges and perfecting a permanent organization to safeguard the welfare of the public as to the quality of the drugs and medicines sold, and to correlate the efforts of all those influences which were at work in different sections for the elevation of pharmacy, and the improvement of the quality of the drugs on the market.

It was at this meeting in 1852 that the American Pharmaceutical Association was formally organized. The objects of the Association as set forth in the articles of association show the lofty ideals of the founders of this organization. The following quotation from the constitution shows clearly the objects which are aimed at:

1. To improve and regulate the drug market by preventing the importation of inferior, adulterated, or deteriorated drugs and by detecting and exposing home adulterations.

2. To encourage such proper relations among Druggists, Pharmacists, Physicians and the people at large, as may promote the public welfare, and tend to mutual strength and advantage.

3. To improve the science and art of Pharmacy by diffusing scientific knowledge among Apothecaries and Druggists, fostering pharmaceutical literature, developing talent, stimulating discovery and invention, and encouraging home production and manufacture in the several departments of the drug business.

4. To regulate the system of apprenticeship and employment, so as to prevent, as far as practicable, the evils flowing from deficient training in the responsible duties of preparing, dispensing and selling medicines.

5. To suppress empiricism, and to restrict the dispensing and sale of medicines to regularly educated Druggists and Apothecaries.

6. To uphold standards of authority in the Education, Theory and Practice of Pharmacy.

7. To create and maintain a standard of professional honesty equal to the amount of our professional knowledge with a view to the highest good and greatest protection to the public.

With such lofty ideals set forth in its articles of association, it naturally followed that the highest type of men in pharmacy were attracted to the organization. The roster of the officers of the association, from the time of its organization in 1852 down to the present, constitutes an honor roll of pharmacists,

---

\*An address delivered before the Exposition session, Friday afternoon, August 13, by Caswell A. Mayo, retiring President of the American Pharmaceutical Association. On this occasion a bronze medallion was presented to the American Pharmaceutical Association which has been deposited with the Historian.

and to be included is a distinction of which any pharmacist might well be proud. Unceasingly during all these sixty-three years this organization has earnestly, intelligently and unselfishly sought for the elevation of pharmacy, the improvement of the conditions surrounding the pharmacist, and the betterment of the quality of the drugs dispensed by them. This organization and its members have played a most important part in the drafting of regulations governing the importation and interstate sale of drugs and chemicals. This organization and its members have kept close watch on the advances in pharmaceutical technique, in chemistry, in pharmacognosy and in materia medica, and have brought their efforts to bear on the technical problems of the collection, manufacture, preparation and dispensing of drugs and chemicals, to the end that the physicians and the public of these United States might be able at all times to have at their command pure drugs properly prepared and carefully dispensed. Since health is the basic essential for human happiness and progress, the members of the American Pharmaceutical Association as conservators of health, have played a most important part in contributing to the public welfare.

The annual reports which have been prepared upon the condition of the drugs found in the market by expert members of the American Pharmaceutical Association, constitutes an invaluable record of progress in the science of botany, pharmacognosy and chemistry. With the aid of these reports, analytical chemists and expert pharmacognocists, whether acting in their private capacity, as employes of buyers and manufacturers of drugs, or as municipal, state or government officials, have been enabled to materially improve the condition of the drug market, and bring about a great betterment in the drugs offered for sale here.

It was the American Pharmaceutical Association which first awoke to the increasing danger to the public welfare from the indiscriminate use of habit-forming drugs, and as a member of that organization, I, myself, had the pleasure of offering a resolution at the St. Louis meeting in 1901, providing for the appointment of a committee of three to investigate and report upon the increase in the traffic in habit-forming drugs, and to propose some means of safeguarding the sale of these drugs, and preventing the further spread of the drug habit. As a result of this resolution a committee was appointed which carried on an investigation in a number of the larger cities as to the use of habit-forming drugs. Following the report of this particular committee, a committee on narcotic legislation was provided for and appointed. This committee was continued from year to year, making voluminous annual reports, until finally a model anti-narcotic law known as the "Beal Anti-narcotic Law" was enacted to serve as a guide for pharmaceutical legislation throughout the United States. Since that time, something like forty states have incorporated this law, wholly or in part, into their statutes, while portions of it have been included in national legislation, either in the Food and Drugs Act of June 30, 1906, or in the Harrison Anti-Narcotic Act of 1914, or in other special legislation.

In the drafting of the national Food and Drugs Act of June 30, 1906, the leaders of the American Pharmaceutical Association took a helpful and influential part. Their hand is also shown at many places in the rules and regulations promulgated by the authorities charged with the execution of the law.

Its representatives acting through the National Drug Trade Conference, a body consisting of delegates from all of the national associations interested in the drug business, played an important part, it might almost be said, a dominating part, in the formulation of the national Anti-narcotic Act, known as the Harrison Law, and which has done more than any other legislation ever adopted towards the suppression of the illegal traffic in and the misuse of narcotic drugs. In view of the fact that the sale of these drugs is an integral and essential feature of the pharmacist's work, and that the many restrictions imposed and the tax placed upon the pharmacist by this law, diminished his profits and increased his labors, it will be clear that the American Pharmaceutical Association in advocating this law had been actuated only by the highest and most altruistic motives.

When the American Pharmaceutical Association was organized no restrictions were placed about the entry into the sale of medicines and drugs. Largely through the labors of this organization and its members, there now exists in every state in the union, carefully drawn laws, setting up certain qualifications which must be fulfilled by any one undertaking the sale or dispensing of medicines at retail. This alone is a most important contribution to the public welfare, and this service alone would have amply justified the existence of the organization.

But the highest service which has been rendered to the American public by this Association has been the installation into the minds of the pharmacists of the United States of the loftiest ideals of devotion to duty, of self-sacrifice, and of public service. Through its influence, the ideals of pharmacy have been uplifted and maintained. The duties of the pharmacist to the state and to his fellow men have kept ever in the foreground, and through the inculcation of these lofty ideals the American Pharmaceutical Association has influenced the pharmacists of the United States, those who were among its members directly, those who were not members indirectly, making of them better men, better pharmacists and better citizens.

The influence of the American Pharmaceutical Association has made itself felt, not only through its members, but through other organizations in which it has been a factor.

It was under the auspices of the American Pharmaceutical Association that a national association was formed, including all the colleges of pharmacy in the United States. This organization known as the American Conference of Pharmaceutical Faculties, has been an important factor in unifying and elevating the standards of pharmaceutical education; and whatever good has been accomplished by this organization redounds to the credit of the American Pharmaceutical Association, under whose auspices it was organized, and with which it is most intimately associated.

It was under the auspices of the American Pharmaceutical Association that the National Association of Boards of Pharmacy was constituted, including among its membership the boards of pharmacy of practically all the states. Through the work of this Association the standards of requirement for entry into the practice of pharmacy in the several states have been unified and elevated, thus bringing into the service of the public as licensed pharmacists, men of

higher attainments and better equipment for the responsible task of preparing and dispensing medicaments.

The limitations of space forbid the entry into details of what has been accomplished by this organization. But one aspect of its activities might well be accentuated at this particular junction, when the interruptions of commerce by the European war had cut off the source of supplies whence many of our drugs have been drawn heretofore. This particular phase of the activity of the Association is the development of the drug supplies of the United States. Reaching from the tropics to the north frigid zone, with a climate embracing every extreme, with lands of every variety, and varying in elevation from below the sea level to an elevation of 15,000 feet, the United States is capable of producing almost every variety of botanical drugs known to civilization and used in medicine. It is the province of the American Pharmaceutical Association to find and point out to collectors the vast supplies of drugs indigenous to this country, and to point the way and encourage research in the culture of drugs not found here, but which are capable of being grown here, so as to make us independent of the remainder of the world.

Surely an organization whose aims are so lofty, whose work is so unselfish, whose membership is so widespread, and whose members are so loyal in their support of the aims, must be reckoned as one of the important factors in the development of the highest national efficiency of the American people; and it is with pride in the Association and with humility at my inability to adequately set forth its claims to recognition, that I here briefly, inadequately and all too poorly state a few only of the reasons why the American Pharmaceutical Association should rank in the public esteem as among the most beneficent and praiseworthy organizations which have enjoyed the hospitality of the California people, and of the Panama Pacific International Exposition.

---

#### A PLEA FOR AN UP-TO-DATE YEAR BOOK.\*

E. N. GATHERCOAL, CHICAGO.

---

*The Present Year Book is Largely an Historical Volume Only.*—The Year Book consists of two distinct parts, namely: The statistical matter (the constitution, by-laws, etc., the list of officers and committees, the report on the funds of the Association, and the lists of members) and abstracts of those papers published during the year that relate to pharmacy, pharmaceutical chemistry and materia medica.

The statistical matter has no value except of an historical nature after the year to which it applies is ended. The abstracts when more than a year old serve but little other purpose than for "looking up the literature" relating to pharmaceutical subjects.

*The Added Values of an Up-to-Date Year Book.*—If the 1916 Year Book could be published during the year 1916, it would be not only up-to-date, a condition decidedly worth while, but would possess other advantages.

---

\* This article is published without comment. Every member has an interest in the Association and discussions develop better methods, new ideas and contribute to the growth and value of the organization to its members.

Membership in the Association is an honor, an empty honor, however, if no one knows about it. The list of members should be also a true directory, but a directory to be of value must be recent. The constitution, by-laws, and rules may be amended or revised at every annual meeting. How worth while it would be to have a complete and accurate copy of these articles within a month or so after the meeting.

The abstracts, if kept up to date, would not only have a much enhanced value for tracing the literature on a subject, but would have a real *reading* value. Readable abstracts, timely and covering the field of pharmacy, not only scientific but commercial, would be a real "drawing card" for the Association.

*The Plan.*—Print the Year Book in six installments issued either as supplements to the Journal or as a separate publication under the name it now bears. The installments might be issued in January, March, May, July, September and November and each contain the abstracts of the previous two months. In addition to the abstracts the January number could include the Index for the previous Year Book; the March number, the Treasurer's report and report on invested funds; the May number, summary of Council motions since the last annual meeting; July number, lists of members in good standing; September number, the minutes of the general and section sessions; November number, the corrected constitution, by-laws, and rules, and list of new officers and committees.

*Binding.*—The installments as described above could be so printed that in the bound volume the statistical portion could all be placed in one part of the book or separated into two parts as is done now. The abstracts would, of course, be presented in a number of divisions in each installment as is done now in the whole book, but it would hardly be possible to so arrange these divisions as to make each complete for the year in the bound volume. There is no great advantage, however, in the present rather elaborate arrangement of abstracts. Each subject must be sought through the index, anyway.

If some members preferred to have their Year Book as a bound volume at the end of the year, the Association could retain their installments, bind them and deliver the volume early the following year. Of course, members receiving the installments as issued would bind same at their own expense.

*Expense.*—The cost of printing and mailing the Year Book in installments would be appreciably less than the present method.

*The Year Books for 1914 and 1915.*—It will cost the Association at least \$7500.00 to prepare the copy, print and distribute, under the present plan, these two Year Books. If the plan as above outlined could be entered upon at once and put into effect for the 1916 Year Book, the January number could be used for the lists of officers and the constitution, by-laws and rules, as revised at the last annual meeting, while the number for next July could contain the lists of members as revised to July 1st. Then there would be nothing left but the abstracts for 1914 and 1915 to be published. These could be prepared and issued in 1916 as two volumes bound under one cover, or bound separately. The cost would be materially reduced and the Association could draw upon the income from the National Formulary to enable it to catch up with its publications.

*The Plea.*—Why not adopt the above mentioned plan for bringing the Year

Book up to date? If there are objections to certain features, modify them so as to correct the objections. Please discuss the proposition. I appeal especially to the Branches and trust that the subject will be brought up promptly for discussion in each of them. Probably no action regarding such a radical change in the Year Book can be nor should be taken without the concurrence of the Association in annual session, therefore the 1914 Year Book should be pushed to completion and publication and be distributed if possible before the next annual meeting. Other plans for changing the present Year Book may be presented to the Association for discussion. Perhaps out of this discussion the Council can formulate and indorse some plan that will get us up to date and present it to the Association for adoption.

In case of the adoption of this installment plan, the Reporter should become in truth the Editor of the Year Book and should be alone responsible for its issue. He can organize a larger force of helpers—there are many capable members willing to serve—assigning each but one or a very few journals, and requiring prompt reports from each. His duties would be largely editing these reports rather than preparing the actual abstracts.

---

## CONTRIBUTIONS OF THE CHEMIST TO THE MANUFACTURE OF PHARMACEUTICAL PRODUCTS.\*

---

FRANK R. ELDRED.

---

The manufacture of medicines is not confined to pharmaceutical houses, since they do not produce many of the medicinal chemicals, volatile oils and other products which may be said to constitute a large portion of their raw materials. Many of these products, however, must pass through the hands of the pharmaceutical manufacturer in order that they may be put in a form suitable for use. It is not easy to draw the line between pharmaceutical manufacturing and the closely allied industries as their fields of activity will frequently be found to overlap; for instance, the study and manufacture of certain alkaloids have been left almost entirely to pharmaceutical chemists and manufacturers although most of the alkaloids have been produced by distinctively chemical manufacturers.

Few industries have been as dependent upon the work of the chemist as that of pharmaceutical manufacturing. Many industries have been developed up to a certain point without the direct assistance of the chemist, but the very beginnings of pharmacy and chemistry were closely linked together and pharmaceutical manufacturing was made possible by the work of the early chemists. It is true that pharmaceutical manufacturing has not always kept pace with the progress in chemistry, yet the chemist, although at times very imperfectly trained, has always been an indispensable factor in the development of the industry and today the successful manufacturers are those who are making use of the most recent

---

\*From symposium on the contributions of the Chemist to American Industries. Paper presented at the 51st meeting of the American Chemical Society, Seattle, Wash., reprinted from the *Journal of Industrial and Engineering Chemistry*.

discoveries in chemistry and medicine and to that end have built up organizations of well trained and highly specialized scientific workers.

The work of the chemist in the pharmaceutical industry has been characterized by the development of new products and improvement in the quality of products already established rather than by any reduction in manufacturing costs, although at the present time much attention is also being given to the latter problem. For many years it has been the custom of the more progressive pharmaceutical manufacturers to devote considerable sums of money to research along the various lines connected with their business, and for this reason much of the credit for the development of our present materia medica should be given to them. Chance and uncertainty in pharmaceutical manufacturing have been largely eliminated, and while ten or fifteen years ago much of the routine manufacturing could be carried on without the direct supervision of the chemist, it is now necessary to have every crude material thoroughly examined, every process controlled and every finished product assayed or inspected by competent chemists.

Among the earlier improvements, due entirely to the pharmaceutical chemist, the standardization of preparations made from vegetable drugs deserves especial mention. The crude drugs were found to vary enormously in strength and as their active principles became known and assay processes were developed, the manufacturers adjusted their preparations so that they were always of uniform strength. At that time the only pharmacopœial standard for such preparations was the fixed amount of drug used in their manufacture and the preparations when finished of course varied according to the strength of the drug from which they were made. The standards established by the manufacturers were based upon the strength of an average prime drug and the quantity of drug required varied inversely with its strength. Most of these standards were adopted by the Pharmacopœia many years later. This like many other improvements made by the chemist in this industry resulted in increased costs not only on account of the analytical work required, but also because of the greater care necessary to maintain these standards.

Thousands of different products are manufactured by every pharmaceutical house, and it has been the duty of the chemist during the past twenty-five years to study these products in order to discover their faults and improve them by modernizing the methods of manufacture. On account of the great number of products to be studied and the diverse problems involved, progress may seem slow, but if we look back even ten years we cannot fail to recognize the great improvement which has been made in the general line of pharmaceutical products. The keeping qualities of many products have been thoroughly studied, although only a few years ago very little was known in regard to the stability of medicines. Much remains to be done, and progressive manufacturers are sparing no effort to improve the quality and raise the standards of their products.

Many of the older classes of pharmaceutical products, however, are rapidly giving way to new medicinal agents which are established on a scientific foundation. This necessitates research with the object of developing new products to take the place of those which are falling into disuse, for the manufacturer who neglects this will see his business gradually going to his competitor who is awake to this necessity. Extracts and tinctures made from vegetable drugs can hardly

be considered scientific products even though standardized to a definite content of the active principles since they always contain many other substances which are either inert or possess undesirable physiological activity. Alkaloids and other definite principles isolated from vegetable drugs have already, to a large extent, taken the place of the various extracts and we may expect even greater progress in this direction during the next few years. The preparation of active extracts and definite principles from the ductless glands is one of the remarkable developments of the last fifteen years. Most of us have witnessed with interest the increase in synthetically prepared medicines from a very small beginning to a point where they are made to meet almost every therapeutic indication. The continued advance along the line of rational and exact medication has led the manufacturer to develop many of these new and improved therapeutic agents.

In one respect the position of the pharmaceutical manufacturer differs from that of manufacturers in other lines. The U. S. Pharmacopœia, a book of standards published under the authority of a convention whose members are appointed by various medical and pharmaceutical bodies, and the National Formulary, published by the American Pharmaceutical Association, have been made the legal standards for all preparations and substances described by them. It is evident that such legal standards are necessary and that the manufacture of medicinal products should be very carefully controlled. This being granted, it is very important that the standards be correct and the control judicious. The U. S. Pharmacopœia is revised decennially by a revision committee chosen by the convention already referred to. In making this revision the committee draws upon the published or privately communicated work of chemists and pharmacists and to some extent upon work carried on under its own direction. Much of the work of chemists for the manufacturing houses has been utilized in the compilation of the Pharmacopœia. Since the revision committee is a representative body in which all classes interested in the preparation and use of medicinal products have a voice, probably no better standards could be established, but it must be recognized that the progress which necessitates the revision of the book every ten years also renders many of the old standards obsolete long before the new edition appears. The National Formulary is a valuable book which was designed to serve as an unofficial guide in preparing commonly used preparations which were not described by the Pharmacopœia and its elevation to the rank of a legal standard seems to have been due to a misconception of its function.

While these two standards have been legalized by the Federal Food and Drugs Act, a very wise clause was inserted in the act which provides that preparations may differ from the standards so established if the standard be *plainly* stated on the label. This clause allows uninterrupted progress during the interval between revisions of the Pharmacopœia and insures new material and improved standards for the use of each revision committee. It is this clause which now enables the chemist to contribute actively to the manufacture of medicinal products.

In some quarters the repeal of this provision of the law has been advocated and since it has such an important bearing upon the relation of the chemist to pharmaceutical manufacturing, it should receive our careful consideration. The repeal of this clause would make it unlawful to market any product which differed in any way from the product described by the Pharmacopœia or National For-

mulary ; manufacturers therefore could not profit by any improvement which they might make and all research tending toward the improvement of such products would be discontinued. When it is remembered that the most important medicines are described in the Pharmacopœia, that many are included in the National Formulary which afterward find their way to the Pharmacopœia, and that many of the articles dropped from the Pharmacopœia are subsequently inserted in the National Formulary, it will be seen that no more effective bar to progress in the production of medicinal products, than the elimination of this clause from the law, could be devised. It may be pointed out that the standardization of extracts and tinctures as well as many other improvements could never have been introduced by manufacturers if no variation from pharmacopœial standards had been allowed. Under such a law while manufacturers in every other line would be stimulated by competition to improve their products, the manufacturer of medicines would be legally prohibited from doing so. The contributions of the chemist to this industry would then be confined to routine analytical work and to the development of products which could be protected by patents ; all improvements in medicinal substances now included in the National Formulary and Pharmacopœia would have to be made by the committees of revision with limited time and facilities and without manufacturing experience. It seems doubtful if such a law could be enforced, but if the matter is placed before our law-makers in the proper light, there can be no doubt that the federal law will remain unchanged and that the state laws will conform to it in this respect. If this course is followed, the progress in this industry, which has never been as rapid as at the present time, will be uninterrupted.

---

#### FEDERAL JUDGE HOLDS THAT MAIL ORDER DRUG HOUSES CANNOT SELL MEDICINES CONTAINING HABIT- FORMING DRUGS BY MAIL.

Medicines containing habit-forming narcotic drugs, traffic in which is forbidden by the Harrison law, cannot be sold through a mail order business, Judge J. E. Sater decided in Federal District Court at Columbus, Ohio, December 4. He dismissed a suit brought by the Dr. Nathan Tucker Asthma Specific Company of Mount Gilead, Ohio, to enjoin B. E. Williamson, Federal Internal Revenue Collector, from seizing the plant.

The court's decision declared medicines containing narcotic drugs may be prescribed by physicians only after a personal examination of the patient before each prescription. Diagnosis by mail is held illegal.

The decision is considered of far-reaching importance, since other proprietary remedies contain narcotic drugs or their derivatives and are sold by the mail order system.

## REPORT OF THE COMMITTEE ON UNOFFICIAL STANDARDS.

The following portion of the report of the Committee on Unofficial Standards relates to certain crude drugs and chemicals suggested for inclusion in the next revision of the National Formulary, and by order of the Council is published in the Journal in order to afford opportunity for discussion before the standards proposed are finally adopted.

Manufacturers, importers, analysts, and others interested in any of the proposed standards, are requested to send their criticisms and comments to the chairman of the committee, George M. Beringer, 501 Federal St., Camden, N. J.

---

CARAMEL  
Caramel

Saccharum Ustum. Burnt Sugar Coloring.

A concentrated aqueous solution of the product obtained by heating sugar or glucose, to which has been added a small amount of alkali or alkali carbonate, until the sweet taste is destroyed and a uniform dark brown mass results.

Caramel is a thick, dark, brown liquid having the characteristic odor of burnt sugar and a pleasant bitter taste.

Specific gravity not less than 1.35 at 25° C.

On spreading in a thin layer on a glass plate, it appears homogeneous, reddish-brown and transparent.

Caramel mixes clear with water in all proportions. One part dissolved in one thousand parts of distilled water, yields a clear solution having a distinct sepia tint and the color of the solution is not changed or precipitated after exposure to sunlight for six hours.

It is soluble in diluted alcohol, but it is precipitated when the alcoholic content of the solution is increased to 80 percent by volume or more.

It is insoluble in ether, chloroform, acetone, benzene, petroleum benzin or turpentine.

20 mls. of an aqueous solution (1:20), is not precipitated on the addition of 5 ml. of phosphoric acid.

On incinerating Caramel, it swells and leaves a coke-like charcoal, which burns off only after prolonged heating at a high tem-

perature, and leaves not more than 8 percent of ash.

CHIONANTHUS  
Chionanthus

Chionan. Fringe Tree Bark.

The recently gathered bark of the root of *Chionanthus Virginica* Linné (Fam. *Oleaceae*), with not more than 8 percent of other parts of the plant or foreign matter.

Usually in transversely curved pieces, occasionally in single quills, 1 to 10 cm. in length; bark 2 to 10 mm. in thickness; heavy, some pieces of the whole drug sinking when thrown into water; outer surface usually reddish-brown, occasionally grayish-brown, few transverse wrinkles, whitish cork patches and root scars; inner surface yellowish-brown, more or less striate and undulating; fracture short, hard, and coarsely granular due to projecting groups of stone cells; the broken surface of a light yellowish-white color.

Odor characteristic; taste bitter.

The powdered drug is light brown in color and when examined with the microscope exhibits; somewhat rounded, simple or 2-4 compound starch grains, mostly 0.003 to 0.010 mm. in diameter, occasionally up to 0.020 mm.; numerous stone cells, in groups and isolated, the walls thick, strongly lignified and with simple or branching pores; fragments consisting of light brownish thin walled cork cells; a large amount of parenchyma tissue, with many of the cells filled with starch grains. *Chionanthus* yields not more than 5 percent of ash.

## CORYDALIS

## Corydalis

## Turkey Corn. Squirrel Corn.

The dried tubers of *Dicentra canadensis* (Goldie) Walp., usually somewhat mixed with the dried bulb-like portions of *Dicentra Cucullaria* (L) Bernh., (Fam. *Fumariaceae*), with not more than 5 percent of other parts of the plants or of foreign matter.

The tubers are rounded and frequently vertically depressed, the flattened surface more or less concave, up to 15 mm. in diameter; usually single, rarely two or more in a cluster; externally, minutely pitted or nearly smooth, grayish-brown, grayish-black or amber colored and more or less translucent; one of the flattened surfaces with a triangular scar from detached roots, the other usually with remains of the slender rhizome; fracture, hard and horny, exhibiting a yellowish waxy interior, or somewhat tough and granular exhibiting a yellow-white interior; nearly odorless; of a bitter taste.

The grains of the granulate bulb of *Dicentra Cucullaria* are plump ovoid or triangular ovoid and up to 12mm. in length; the larger grains distinctly concave on one surface, with a scar at the apex from the detached petiole, and usually attached to the short root-stock in clusters of three; the smaller grains usually separated from the rootstock, with an acute apex and a scar at the base; externally, yellowish or grayish-brown, usually translucent; fracture, hard and horny exhibiting a grayish waxy interior or granular and tough exhibiting a whitish interior; nearly odorless; of a slightly bitter taste.

The powdered drug is of a light yellow or of a yellowish-gray color, and when examined with the compound microscope exhibits: numerous oval, ovoid or oblong simple starch grains, the broad end of the grain sometimes truncate, up to 0.060 mm. in length and frequently with a cleft or horseshoe shaped fissure in the small end of the grain; occasionally two compound grains; altered starch grains up to 0.090 mm. in length; numerous angular or rounded parenchyma cells isolated or in groups and containing more or less altered starch grains the outlines of which are indistinct; tracheae few with reticulate, simple pores, annular or spiral markings; fragments of epidermal cells with thin brownish walls; sclerenchyma fibers very few or

wanting; few characteristic sclerotic cells from the root stock of *Dicentra Cucullaria* irregular in outline, mostly elongated up to about 0.750 mm. in length and 0.100 mm. in width, walls heavily lignified and porous and about 0.020 mm. thick, occurring isolated or in groups of from two to four; very few sclerotic cells from the rhizome of *Dicentra canadensis*, mostly isodiametric, uniformly smaller than in *Dicentra Cucullaria* and with walls about 0.012 mm. thick, not distinctly irregular in outline; a very few rosette aggregates of calcium oxalate, up to 0.020 mm. in diameter, from the portions of rhizome of *Dicentra canadensis*.

An infusion prepared by placing 5 grammes of ground or powdered corydalis in 100 mls of hot distilled water, stirring occasionally during ten minutes and then filtering is of a light amber color, gives an alkaloidal ppt. with potassio-mercuric iodide T. S. and a dark blue color with Iodine T. S. (soluble starch).

Corydalis yields not more than 8 percent of ash.

## MATICO

## Matico.

The dried leaves of *Piper angustifolium* Ruiz and Pavon (Fam. *Piperaceae*) with not more than 5 percent of stems, flower spikes, or foreign substances.

Usually in compressed, matted masses with leaves more or less broken. Leaves subsessile, lanceolate, 10 to 20 cm. long, 2 to 5 cm. broad; apex tapering and acute; base slightly unequal, cordate; margin finely crenulate; upper surface dark green tessellated; lower surface pale green, reticulate with prominent yellowish-brown midrib and veins forming small quadrangular meshes clothed with matted pubescence.

Odor distinct, aromatic; taste pungent, pepper-like.

Sections viewed under the microscope exhibit: The epidermis, that of the upper side composed of regular polygonal cells and of the lower side of somewhat irregular and bent cells especially where covering the veins; numerous stomata and large bordering cells on the lower side; the hypoderm of 1 row and palisade cells in 2 or 3 rows; mesophyll of loose, spongy tissue; midrib in cross section oval, outer layer of thick walled

cork cells; secretion cells filled with yellow oil; upper surface with papillae and few bristly hairs; hairs of the lower surface of two kinds, the one 6 to 10 cells long, pointed, bent and matted and with thick walls and streaked cuticle; the other bristle hairs of one stem cell and a cap cell; calcium oxalate crystals few in parenchyma tissue of the venation, some raphides, others tabular.

Powder greenish-yellow and under the microscope exhibits the characteristic hairs, polygonal epidermal cells, and secretion cells of the leaf.

Matico yields not more than 18 percent of ash.

#### OLEUM BETULAE EMPYREUMATICUM RECTIFICATUM

Rectified Empyroligneous Oil of Birch.

Rectified Oil of Birch Tar. Oleum Rusci Rectificatum.

The empyroligneous oil obtained by the dry distillation of the bark and wood of *Betula alba* Linne (Fam. *Betulaceae*), rectified by steam distillation.

Limpid, dark brown liquid having a penetrating empyreumatic, tarry odor resembling that of Russian leather.

Specific gravity: 0.886 to 0.950.

It yields clear solutions with three times its volume of either absolute alcohol, ether, chloroform, glacial acetic acid, amyl alcohol, turpentine, benzole and carbon disulphide; not more than slightly turbid with the same volume of alcohol or purified petroleum benzine, and a decidedly turbid mixture with the same volume of methyl alcohol.

Warm 2 mls with 10 mls of distilled water, agitate and allow the mixture to cool, separate and filter the aqueous liquid. It should be colorless, have a strong empyreumatic odor and an acid reaction. 2 drops of potassium dichromate U.S. added to 1 ml of the aqueous filtrate produces a bright yellow solution which becomes darker and turbid. 1 drop of dilute ferric chloride solution (1 in 100) added to 1 ml of this filtrate produces a green coloration which changes to brown and becomes turbid (Distinction from Oil of Cade).

#### VANILLA

Vanilla Bean.

The cured, full-grown, unripe fruit of *Vanilla planifolia* Andrews (Fam. *Orchidaceae*).

Pods linear, flattened, from 15 to 35 cm. in length and from 5 to 9 mm. in breadth; summits terminating in flat circular scars; gradually tapering, more or less bent and curved or hooked at the bases, or in the Tahiti variety, broad in the middle and tapering towards either end, the base closely resembling the summit; externally blackish-brown, longitudinally wrinkled, moist-glossy, and occasionally with an efflorescence of vanillin in the form of acicular crystals or monoclinic prisms; frequently with narrow, elliptical or irregular, more or less wrinkled, dark-brown patches of cork; occasionally split into three parts near the tip, flexible and tough, 1-locular, containing a blackish-brown pulp and numerous blackish-brown seeds; the latter being flattened, irregularly triangulate or nearly circular in outline, reticulate and varying from 0.250 to 0.300 mm. in diameter; odor and taste characteristic and very agreeable.

Under the microscope, transverse sections of the pods of Vanilla show an epidermis with a somewhat thickened outer cuticularized layer having occasionally rounded or conical masses of the excretion of a gum-like substance; a layer of collenchyma of 1 or 2 rows of cells; a thick sarcocarp composed of parenchyma cells in which are imbedded an interrupted circle of fibro-vascular bundles; the parenchyma cells are deeply undulate in outline and usually contain a thin protoplasmic layer enclosing numerous oily globules or may contain bundles or raphides of calcium oxalate, the individual crystals varying from 0.200 to 0.400 mm. in length; some of the parenchyma cells are specially modified and distinguished by their somewhat thickened walls with long, oblique, slit-like pores or the thickening may extend in the form of broad, spiral bands; in the fibro-vascular bundles the phloem is central, being more or less surrounded by a few tracheae, the walls possessing slit-like pores or spiral thickenings, and at the outside of the bundle is a closed circle of sclerenchymatous fibers, the walls being thin, strongly lignified, pro-

vided with numerous, transverse, simple pores, the outer wall of the outer row of fibers being irregular or sinuate; from the inner walls of the endocarp arise the placenta bearing numerous brownish-red or blackish seeds; otherwise from the cells of the endocarp arise numerous long, nearly straight hairs, the ends being rounded, the hairs being more or less matted together by a gummy or resinous mass in which some of the seeds are held; in mounts made in hydrated chloral T. S. or potassium hydroxide T. S., the immature, brownish-red seeds show

a deeply reticulate seed-coat, the cells being of an oblong-polygonal form in surface view.

Place a few of the crystals, occurring as an efflorescence on the fruit, on a microscope slide or watch crystal and add a drop of phloroglucinol T. S. and hydrochloric acid, the solution immediately should acquire a carmine-red color (distinction from *benzoic acid*).

The amount of extractive, using dilute alcohol, should be not less than 12 percent.

Vanilla yields not more than 6 percent of ash.

---

### STREET DIRT, UNPROTECTED FOOD AND DISEASE.

Prof. C. H. La Wall, chemist of the Pennsylvania dairy and food commission, is said to have found the following assortment of objects and substances in raisins exposed for sale on a Philadelphia street: Pieces of prunes; beans and rice; strands of human hair and cat fur; cotton and wool fiber; straw and bits of bran; insect wings and legs; cigar and cigaret ashes, and a yellowed cigaret paper. While it does not appear that any of these unappetizing accessories were exactly proved to be carriers of contagion, the findings strongly suggest the possibilities of infection from food sold from uncovered pushcarts and stands.

---

### THE VISCOSITY OF LIQUID PARAFFIN.

The importance of the viscosity of liquid paraffin is engaging the attention of medical men. *The London Lancet* has shown that the viscosity is more important than the specific gravity, for whereas the specific gravity may be the same for different samples the viscosities vary considerably. The higher the viscosity the more suitable is the oil for medical use as an internal lubricant. The viscosity at 100° F. (Redwood) varied in a series recently examined from 440 to 67 seconds. Medical men are awakening to the importance of high viscosity in liquid paraffin, and pharmacists may receive inquiries on this matter.

---

### NOTICE TO EXCHANGES, ADVERTISERS, CORRESPONDENTS, ASSOCIATIONS, BOARDS OF PHARMACY, MEMBERS, BRANCHES OF A. PH. A., ETC.

The Office of the Journal of the American Pharmaceutical Association has been moved from 63 Clinton Building, Columbus, Ohio, to Philadelphia Drug Exchange, Bourse Building, Philadelphia, Pa. All communications, publications, etc., for the Journal and Editor, E. G. Eberle, should be addressed accordingly.

## Editorial Notes and Announcements

E. G. EBERLE, Editor.....Columbus, Ohio

All communications for insertion in the JOURNAL, or respecting advertising should be sent to the Editor.

The Association does not accept responsibility for the opinions of contributors. Offensive personalities must be avoided.

Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers. Subscriptions and association dues should be sent to the Treasurer, H. M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Requests for back numbers, and claims for missing numbers should be sent to the Editor.

Claims for missing numbers will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from the date of issue.

### REPRINTS.

If the request is made at the time copy is submitted, authors will be furnished reprints by the Stoneman Press Co. at the following prices, provided the order is received before the type has been distributed:

- 100 copies, 4 pages, no cover, \$2.50, with cover, \$4.50.
- 200 copies, 4 pages, no cover, \$3.00, with cover, \$5.50
- 50 copies, 8 pages, no cover, \$2.75, with cover, \$4.50.
- 100 copies, 8 pages, no cover, \$3.50, with cover, \$5.00.
- 200 copies, 8 pages, no cover, \$4.50, with cover, \$6.50
- 50 copies, 12 or 16 pages, no cover, \$4.00, with cover, \$5.50.
- 100 copies, 12 or 16 pages, no cover, \$5.00, with cover, \$6.50
- 200 copies, 12 or 16 pages, no cover, \$6.50, with cover, \$8.00

Orders for reprints may be sent either to the Editor, or to the Stoneman Press Co., Columbus, Ohio.

### A NEW FOOD?

The daily papers are apt to report as new and wonderful discoveries familiar things or those not of such recent discovery, but unfamiliar to their readers.

The story, to which the title has reference, is reported about as follows: "A bacteriologist in one of the trenches of Belgium discovered a mold which possessed a wondrous power of turning sugar into fat. Another yeast had been discovered which with the assistance of ammonium sulphate, will produce a considerable percentage of protein or 'meat'."

We do not desire to say that practical application will not be made and possibly a serviceable food will be developed, but the idea of utilizing yeast as food is not new nor, of course, the fact that starch and sugar and some form of nitrogen are converted into fat and protein. This is what occurs in animal and vegetable life.

Yeast in some form or other has been for ages and is now used as food and medicine. At one time it was quite extensively employed in the treatment of diabetes, because of its action on sugar. Experiments were made several years ago to determine the food value of yeast, when it was found that in limited amounts it was not objectionable, but prolonged or more extended diet produced disturbance of the digestion.

### NOBEL PRIZES AWARDED.

The Nobel prize for physics has been awarded to Professor Meel von Laue of Frankfort-on-the-Main, for his discovery of the diffraction of rays in crystals. The chemistry prize has been awarded to Professor Theodore William Richards of Harvard University, for fixing the atomic weights of certain elements. Professor Richards is director of the Gibbs memorial laboratory at Harvard, and a member of the International Commission on Atomic Weights. In 1910 he was awarded the Davy medal by the Royal Society of Arts and Sciences and in 1912 he received the Willard Gibbs medal from the American Chemical Society.

### SUBSTITUTE SPECIFICS SEIZED

Recently throughout the country, worthless imitation drug products have been seized by officials in charge of the enforce-

ment of the Food and Drugs Act. Itinerant peddlers are selling these imitations, made up and labeled similar to the preparations they are intended to represent. They do not confine themselves to the drugs, but dispose of them in tablet and other forms for administration. The reference is made because some of these venders are very persuasive and there is no limit to their assurance.

## Obituary

SAMUEL A. D. SHEPPARD  
Treasurer of the American Pharmaceutical  
Association from 1886-1908

While not unexpected, because of the enfeebled health of Mr. Sheppard, the news of his death came as a shock to his many friends. We regret deeply that the Journal is not in position to have a more extended reference of this lamented friend and member, but in the next issue further tributes will be published.

We know that ex-President John G. Godding will pardon our making use of a communication addressed to Secretary J. W. England of the Council A. Ph. A., and received just before completing this number of the Journal. The letter follows:

"You probably have learned of the passing away of our dear friend, S. A. D. Sheppard with pneumonia, on Sunday, November 28th. He was on his way to Pinehurst, N. C., stopping over with his son Robert at Newton Centre, where he was taken ill and passed away surrounded by relatives and friends. Funeral was from the son's residence, Wednesday, December 3d, and was largely attended. Members of the Board of Trustees of the Massachusetts College of Pharmacy and representatives from other pharmaceutical organizations were present. The services were conducted by the Rev. Mr. Cleaves, the pastor of the church which he attended at Newburyport during the summer. Interment was at Newton Cemetery. The floral offerings were many and beautiful.

"This removes one of the best known Pharmacists in New England, a genuine lover of his profession who has given liberally of his time and money for its interest. Personally I lose a friend of long acquaintance begun at the M. C. P. as classmate and working with him later for the interests of the M. C. P. our friendship strengthened as years passed by. A man of sterling character, companionable and lovable, considerate of those who did not agree with him. Thus the world loses a good citizen.

"His last appearance in public was last May at the Massachusetts College of Pharmacy Commencement where in the presence of a large audience he was given an Honorary Degree. His acceptance was in his usual bright and cheery manner with much good advice to those graduating.

"His passing away was as peaceful and beautiful as the life he had lived. We are better for having known him and fortunate to have been included in the circle of friends. His works and deeds will remain a monument to his memory.

Signed, JOHN G. GODDING."

## DERWENTWATER KIRKLAND

Derwentwater Kirkland, one of the most widely known drug men on the Pacific Coast, died on November 1, at the Fremont Hotel, Los Angeles, Cal. He was born on the high seas when his mother and father were enroute to Canada from Australia. He received his education and degree of pharmacy in Canada, and went to California in 1876, where he engaged in the drug business.

Some years later he conceived the idea of organizing a drug corporation to operate a string of retail stores throughout the western coast states and formed the Owl Drug Company, being elected its president. Six years ago, he resigned the presidency of the Owl Drug Company and retired, but later, with his brother, John Kirkland, organized the American Drug Company, which now has two large stores in Los Angeles. During the forty years he was in business in California, Mr. Kirkland made a host of friends. He became a member of the American Pharmaceutical Association in 1889. He was sixty years of age, and is survived by one sister and three brothers.

J. W. E.

&lt;&gt;

## DR. JOSEPH A. HEINTZELMAN

Dr. Joseph Augustus Heintzelman, a member of the American Pharmaceutical Association since 1858, aged eighty-one years, died at his residence, 2000 Ridge Avenue, Philadelphia, on October 19, 1915. For 51 years he has been a practicing physician and pharmacist in the neighborhood where he lived. He was graduated from the Philadelphia College of Pharmacy in 1859. He was prominent in the Masonic fraternity and in various German organizations. Dr. Heintzelman was a genial, lovable pharmacist of the old-fashioned school, and loved his profession.

Dr. Heintzelman is survived by two sons and a daughter, one of the sons being Dr. Joseph Heintzelman, Jr.

J. W. E.

&lt;&gt;

## DEATH OF MRS. MERRELL

Mrs. Cornelia Spear Merrell, widow of the late George Merrell, for many years president of the Wm. S. Merrell Chemical Company, and one of the best known pharmaceutical men in the country, died at the family residence in Cincinnati on November 12th, surviving her husband but eleven months to the day.

Mrs. Merrell was the eldest daughter of Samuel and Rachael Spear. She was but twenty and Mr. Merrell twenty-one when they were wedded. Their married life was a most ideal one and so tenderly united were they that Mrs. Merrell never rallied after the death of Mr. Merrell. Even those who were most near and dear to her felt that in her passing it was as she would have wished it for they are now together.

Mrs. Merrell was most active in club work in Cincinnati, where her executive ability was always most highly appreciated.

Surviving her are two brothers, Joseph C. Spear, secretary of the Spring Grove Cemetery Association, and George Spear, president of the St. Louis Edible Nut Company, and three sons, Stanley W. Merrell, one of the judges of the Superior Court, and Charles G. and Thurston Merrell, actively connected with the Merrell Company.

## The Bulletin Board

Bulletin VI—Financial report of the National Committee on the Pharmaceutical Syllabus, September 28, 1914, to July 31, 1915.

## RECEIPTS.

Sale of 144 copies of the Syllabus and a/c postage on same.....	\$164.71
Contribution from American Pharmaceutical Association .....	25.00
Contribution from American Conference of Pharm. Faculties.....	25.00
Contribution from National Association of Boards of Pharmacy.....	25.00
Proceeds of note for \$200, due September 18, 1915, to Paul Revere Trust Company, Boston.....	195.87
<b>Total .....</b>	<b>\$435.58</b>

## EXPENDITURES.

C. F. Williams & Son, balance on bill for printing .....	\$242.95
Henry L. Taylor, repayment of cash advanced .....	115.82
Postage .....	21.35
Printing letterheads, envelopes, order blanks, etc. ....	14.75
Typewriting and duplication of bulletins .....	11.00
Express charges .....	3.74
Stencil paper for bulletins.....	3.40
Premium, insurance on plates for printing Syllabus .....	2.00
Exchange on checks.....	1.70
<b>Total .....</b>	<b>\$416.71</b>

	<b>\$435.58</b>

BROOKLYN, N. Y., Nov. 5, 1915.

This is to certify that I have compared this report with the books and vouchers of the Secretary-Treasurer, and find the same to be correct.

WILLIAM C. ANDERSON, Auditor.

The receipts from the sale of the Syllabus include a small amount received and forwarded by Dr. Henry L. Taylor, the preceding secretary-treasurer.

Some copies were sold at \$1.00 each and others at \$1.25, plus postage.

The note to the Paul Revere Trust Company was made by vote of the executive committee and the proceeds were used to pay all other indebtedness. When this note came due in September, \$100 was paid on it and a new note for \$100 given for the balance.

All twenty-one members of the committee voted affirmatively on Motion 271, to allow the Journal of the American Pharmaceutical Association to use the committee's plates of portraits of deceased pharmaceutical workers. The plates have been forwarded to Editor Eberle and several have already been used.

The president of the American Pharmaceutical Association has appointed George M. Beringer to succeed himself on the Committee, also Professor P. Gerhard Albrecht for the unexpired term of Henry L. Taylor, resigned.

The National Association of Boards of Pharmacy has elected Ellis E. Faulkner to succeed Charles Gietner and the American Conference of Pharmaceutical Faculties has elected Theodore J. Bradley to succeed himself.

With these changes the Committee now has the following membership:

#### From American Pharmaceutical Association:

##### Term

##### Expires

- 1916. William B. Day, Chicago, Ill.
- 1917. Willis G. Gregory, Buffalo, N. Y.
- 1918. P. Gerhard Albrecht, Cleveland, Ohio.
- 1919. Charles Caspari, Jr., Baltimore, Md.
- 1920. Eugene G. Eberle, Dallas, Tex.
- 1921. Harry B. Mason, Detroit, Mich.
- 1922. George M. Beringer, Camden, N. J.

#### From National Association of Boards of Pharmacy:

- 1916. William Mittelbach, Booneville, Mo.
- 1917. John W. Gayle, Frankfort, Ky.
- 1918. William H. Rudder, Salem, Ind.
- 1919. George C. Diekman, New York, N. Y.
- 1920. Mason C. Beebe, Burlington, Vt.
- 1921. John Culley, Ogden, Utah.
- 1922. Ellis E. Faulkner, Delton, Mich.

#### From American Conference of Pharmaceutical Faculties:

- 1916. Henry H. Rusby, Newark, N. J.
- 1917. James H. Beal, Urbana, Ill.
- 1918. Charles W. Johnson, Seattle, Wash.
- 1919. Clement B. Lowe, Philadelphia, Pa.
- 1920. William C. Anderson, Brooklyn, N. Y.
- 1921. Julius A. Koch, Pittsburgh, Pa.
- 1922. Theodore J. Bradley, Boston, Mass.

Respectfully submitted,

THEODORE J. BRADLEY,  
Secretary-Treasurer.

Boston, November 15, 1915.

## Societies and Colleges

### STATE BOARD "GUARANTEED."

Up to the present time candidates can take the State Board Examination as pharmacist in New Jersey without any preliminary education and without being graduates of recognized colleges of pharmacy. A number of "fakers" have taken advantage of this.

For years there have been rumors that certain parties were getting sums of money from students on the assurance that through friendliness or "pull" with members of the State Board they could have students passed. Sums ranging from \$50.00 to \$300.00 have thus been extracted from the victims.

Naturally these rumors have been anything but pleasing to the board members, and while they have been prosecuting an investigation, they have been unable, up to this time, to obtain evidence, it is understood, that would warrant laying the matter before the authorities for prosecution.

In addressing the 160 persons who were taking an examination at the State House in Trenton, New Jersey, President Strauss told them that it was unwise to pay out their money under such promises. It was pointed out that persons could legally give them instructions, but when they accepted money with the inference that through influence or pull with the members of the Board they would be passed, these individuals were going too far.

It is reported that evidence has been secured against one of these "fakers" who is now held by the Grand Jury of Hudson County. No doubt this will act as a warning against other "fakers" who are obtaining

money under false pretenses from their victims. It is also high time that such practices be stopped by the enactment of a law requiring college of pharmacy education in New Jersey.

OTTO RAUBENHEIMER, Phat. D.

<>

#### AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

*Work of the Association.*—The American Association for the Advancement of Science will hold its next convocation-week meetings in Columbus, Ohio, from December 17, 1915, to January 1, 1916, under the presidency of Dr. William Wallace Campbell, Director of the Lick Observatory, Mt. Hamilton, Cal.

The annual meetings are usually attended by two thousand or more of scientific men and women and it is expected that the coming meetings will surpass previous meetings in the importance of their scientific programs.

<>

#### PERFUMERS PLAN CAMPAIGN AGAINST STAMP TAX.

By a unanimous vote, members of the Manufacturing Perfumers' Association of the United States placed that organization on record as unalterably opposed to the proposed re-enactment by Congress of the emergency revenue stamp tax on perfumes, cosmetics and similar toilet articles and made plans for preventing the passage of such a measure in the forthcoming session of Congress, at a special meeting, held November 15, in the Hotel Biltmore, New York City.

<>

#### MEETING OF THE EXECUTIVE COM- MITTEE OF THE ILLINOIS PHAR- MACEUTICAL ASSOCIATION.

The semi-annual meeting of the Executive Committee of the Illinois Pharmaceutical Association was held at the office of the Secretary in Chicago on Tuesday, November 16, 1915.

There were present at the meeting, President J. H. Riemenschneider, Third Vice-President J. R. Phillips, Secretary W. B. Day, Executive Committeemen H. J. Holtboer, L. M. Light, John Lueder, J. P. Crowley, J. J. Boehm, L. P. Larsen, H. E.

Schaper, O. H. Mentz, W. D. Duncan, H. C. Porter, Hugh Marshall, H. O. Hartley, C. F. Frison, W. F. Baum, G. M. Bennett, E. H. G. Kreiling, R. A. Clarkson, P. L. Gain, F. L. Pfaff, J. C. Wheatcroft and G. W. Bower, also Mr. J. H. Wells of the Legislative Committee and F. M. Mares of the School of Pharmacy Committee.

The report of the Treasurer was read and showed a balance in the treasury as follows: In the general fund \$1252.14, in the permanent fund \$600.00, in the Beal prize fund \$100.00.

The President reported verbally outlining the Membership campaign which is being carried on successfully with the aid of a committee of one hundred members. President Riemenschneider urged the members of the Executive Committee to give their earnest aid in furthering this membership campaign.

The Secretary reported verbally and stated that more than one hundred new members had been received since the last annual convention; an excellent start for the membership campaign.

President Riemenschneider announced his intention of bringing the total up to five hundred new members before the next convention. He stated that the Illinois Pharmaceutical Travelers had pledged their cordial support and had already sent in a number of applications.

A letter from Mr. R. E. Dorland, Chairman of the Legislative Committee, making suggestion as to proposed legislation was read. Upon motion of Mr. Boehm it was ordered that one or more letters be sent to all the druggists of Illinois as soon as Congress meets to urge the druggists to write their congressmen at once opposing further imposition of stamp taxes and favoring the Stevens Bill.

Upon motion of Mr. Crowley it was ordered that the Chairman of the Legislative Committee be instructed to formulate a program for proposed legislation and present this program at the annual convention in Springfield next June.

It was decided that the Secretary should take care through his office of such bills for printing and postage as will be necessary for the work of the Committee.

Upon motion of Mr. Wells it was decided that the Propaganda campaign be deferred until the annual meeting on account of changes now being made by reason of the

revision of the U. S. Pharmacopœia and National Formulary.

The nominations for the voting cards for Board of Pharmacy and Advisory Board were then considered. The Chicago members in caucus presented nominations of Chicago members for these voting cards. The committeemen from the other congressional districts presented names of the members in their districts. By vote the President and Secretary were authorized to fill vacancies. The complete list follows:

#### CANDIDATES FOR THE BOARD OF PHARMACY.

Congressional Districts 1 to 10 inclusive—Bruno Schultz, Chicago; Theophilus Schmid, Chicago; W. T. Adams, Chicago; Frank Dubsky, Chicago; John J. Chwatal, Chicago; John Myers, Chicago; T. Mygdal, Chicago; Harry Moyer, Chicago; Jacob Topf, Chicago; Fred O. Schmidt, Chicago; District 11, Edwin Hall, Elgin; District 12, E. J. Feurer, LaSalle; District 13, Fred Skeyhan, Rockford; District 14, P. D. Roark, Macomb; District 15, R. C. Webster, Canton; District 16, John Kneer, Jr., Peoria; District 17, W. T. Shorthose, Bloomington; District 18, C. F. Ehlers, Danville; District 19, Archer T. Davis, Decatur; District 20, Byron Armstrong, Jacksonville; District 21, Stuart Broadwell, Springfield; District 22, G. A. Hartnagel, E. St. Louis; District 23, C. F. Greer, Centralia; District 24, W. A. Ball, Carmi; District 25, Thomas Rixleben, Jonesboro.

#### CANDIDATES FOR THE ADVISORY BOARD UNIVERSITY OF ILLINOIS

Congressional Districts 1 to 10 inclusive—George McDonald, Chicago; Louis A. Schmid, Chicago; Wm. P. Knoche, Chicago; Paul Finninger, Chicago; Samuel Antonow, Chicago; George Horn, Chicago; W. I. Knick, Chicago; George Moyer, Chicago; Andrew Scherer, Chicago; John V. Lee, Evanston; District 11, P. M. Fahrner, Joliet; District 12, C. J. Lutz, Ottawa; District 13, Gus Kirchner, DeKalb; District 14, E. Jericho, Moline; District 15, T. B. Shaffer, Oneida; District 16, Albert Zimmerman, Peoria; District 17, A. F. Reinders, Mt. Pleasant; District 18, Peter X. Senger, Danville; District 19, Geo. Cunningham, Champaign; District 20, F. S. Tarbill, Havana; District 21, W. E. Claypool, Springfield; District 22, J. W. Gain, E. St. Louis; District 23 L. H.

Reed, Centralia; District 24, Ferne E. Peters, West Salem; District 25, F. M. Hewitt, Carbondale.

Upon motion of Mr. Wells it was decided to extend an invitation to some prominent pharmacist to address the next annual convention. The arrangements were left with the President and Secretary.

A discussion then ensued as to the arrangement of the program and the annual convention. Upon motion of Mr. Light it was ordered that the business program be prepared by the President and Secretary.

The following resolution was offered:

"WHEREAS, The National Drug Clerk, published at Chicago, has been and is now advocating measures and principles which, if put into effect, will materially increase the expenses of the already overburdened retail druggists throughout the State of Illinois. Be it

*Resolved*, That the advocacy of such measures and principles by the National Drug Clerk are considered by the executive committee of the Illinois Pharmaceutical Association, inimical and detrimental to the interests of retail druggists, and that those who aid or encourage the publication or advocacy of such matters are, in our opinion working against the interests of, and for conditions that may ultimately cause the financial ruin of many retail druggists."

The resolution was quite fully discussed and was carried without division.

Upon motion of Mr. Light the President was instructed to appoint a committee of three to investigate the securing of greater publicity for the Association work generally.

The meeting then adjourned.

W. B. DAY, Secretary.

#### STATE UNIVERSITY OF IOWA. COLLEGE OF PHARMACY.

The Short Course Drug Conference was postponed from November 12 and 13 to Nov. 30 and Dec. 1.

Among the speakers were Dean F. J. Wulling, of Minnesota, Dr. J. H. Beal, of the University of Illinois, and H. B. Mason, of Detroit.

The following topics were discussed by the speakers:

Elements of Competition

Efficiency as applied to the Management of a Drug Store.

Advertising.

Knowing your Goods.

Accounting.

Economics of Business.

Store Arrangement and Decoration.

Salesmanship.

Store Management.

Discussion of the Stevens Bill.

Discussion of the Harrison Law.

Phi Delta Chi held their Founders' Day banquet on Friday, November 5, at the chapter house on Clinton St.

Dr. C. S. Chase acted as toastmaster and responses were given as follows:

The San Francisco Convention of Phi Delta Chi, Dean W. J. Teeters.

Professional and Academic Fraternities, Prof. R. A. Kuever.

Inconsistencies, L. K. Fenelon.

The Fraternity from the Standpoint of an Alumnus, H. F. Duden.

Phi Delta Chi as We are and as We Hope to Be, J. C. Lick.

Out-look of a Pledge, R. D. Stewart.

<>

#### COLLEGE OF PHARMACY, UNIVERSITY OF MICHIGAN.

A silver loving cup, to be known as the A. B. Prescott Scholarship Cup, will be awarded by the National Organization to the chapter of Phi Delta Chi which ranks highest in scholarship. The chapter winning it for three years in succession will be entitled to retain it permanently.

Azor Thurston, of the class of '81, has established a "Scholarship Prize" of \$25, which will be awarded annually to the active chapter of the Phi Delta Chi which obtains the highest average grade. There will be some keen competition from now on and the results will be awaited with great interest.

Wilber F. Jackman of Detroit, Mich., A.B. '86, Ph. C. '87, formerly Professor of Pharmacy in the College of Pharmacy of the University of Maine, has associated himself with Professor Charles H. Rogers, Ph.C. '11, on the teaching staff of the newly organized College of Pharmacy of the University of West Virginia, Morgantown, W. Va.

<>

#### COLLEGE OF JERSEY CITY.

The Department of Pharmacy of this College has adopted the standards of the Re-

gents of New York, beginning with the Collegiate year 1915-16. At the meeting of the Board of Regents of the University of the State of New York, held in Albany, on October 21, 1915, the Department of Pharmacy of the College of Jersey City has been officially recognized and has thus become a Registered College of Pharmacy. Consequently, the graduates beginning with May, 1916, are enabled to take the State Board Examination for Licensed Pharmacist in the State of New York.

<>

#### NEW YORK COLLEGE OF PHARMACY.

The Membership Committee of the Board of Trustees presented applications for membership from the following gentlemen, who were elected at the last Trustees' meeting: Samuel Albert, Joseph Altman, Richard A. Austin, Frank A. Coleman, Jerome A. Crane, Emanuel J. Emelin, Philip Fitz, B. C. Gould, Frederick W. Kaye, J. C. Keogh, G. C. Klippert, Bela Kramer, John Leverty, John A. Leikauf, George W. Luft, William A. MacDonald, George Phillips, Edward Plant, Robert Plant, J. W. Reed, E. R. Rogers, David Schwartz, William L. Snow, Harry E. Steinhilber, Rudolph Theis, M. R. Thurlow, Adolph Wiegand, J. Warren Wiley, A. W. Yates.

It is a source of great satisfaction that the retail pharmacists of New York City are showing a new interest in the work carried on by the College. This institution was founded and is maintained under the supervision of an association composed almost entirely of retail druggists, with the main object of preparing young men to become efficient and valuable clerks in their stores. As every registered pharmacist in this state must be a graduate of a recognized college of pharmacy, it should be of personal interest to every druggist to see that the College in his city is in a position to present the best in pharmaceutical education. It is the aim of the Trustees and present members to have every retail pharmacist in New York City a member of the College. The College has lost by death, in recent years, some of its best friends, and although their places have been taken by those who are carrying on the work in the same progressive and wholly satisfactory way, still it is necessary, in looking to the future, to continually add new blood to the organization. The number of new

members already elected this year is a big step in the right direction.

The Senior class of the College has elected the following officers: President, G. Harold Dowsey; Vice-President, Mrs. Estella J. Baddour; Secretary, Victor Johnson; Treasurer, Conrad Klingele; Historian, Miss Mary E. Meier.

#### CHICAGO VETERAN DRUGGISTS' ASSOCIATION.

The meetings of the Chicago Veteran Druggists' Association should stimulate the druggists of every large city to organize for like purposes. Such organizations offer the opportunity for those who are closely linked to early pharmacy of this country to reminisce and inform the younger generation of the progress in pharmacy that is being made. It keeps the older members young in spirit and permits them to enjoy happy companionship.

At the Detroit meeting of the American Pharmaceutical Association it was resolved to encourage similar organizations by the Branches. Evidently little has been done in that direction but the Chicago Association continues to enjoy the meetings and profits thereby.

Recently the 86th birthday of Honorary President O. F. Fuller was appropriately observed, a farewell celebration was tendered member Albert Hunt who departed for California to join with members Jamieson and Patterson, and a memorial meeting was held in memory of F. J. Schroter.

Thus it is that good cheer and deep sorrow formulate the program of these gatherings. Those who have passed away are remembered, and the living enjoy the pleasures of fraternity.

#### TWO COMPOUNDS OF EMETINE WHICH MAY BE OF SERVICE IN THE TREATMENT OF ENTAMEBIASIS.

A review of the history, chemistry and pharmacology of ipecac, with the suggestion that emetine mercuric iodide and emetine bismuthous iodide be used in the treatment and also in the prophylaxis of entamebiasis. Emetine mercuric iodide is prepared by precipitating an acidified aqueous solution of emetine hydrochloride with Mayer's reagent, collecting, washing the precipitate with water and drying in the air, below 50°. Emetine bismuthous iodide is prepared in a similar way by the use of Dragendorff's instead of Mayer's reagent. Theoretically these compounds should be decomposed only slightly in the stomach, but should liberate emetine in the intestinal tract. The compounds may be given in doses of 0.03 gm. without causing nausea or vomiting.—Chemical Abstracts.

### Proceedings of the Local Branches

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

#### NEW YORK.

Minutes of the regular meeting of the New York Branch of the American Pharmaceutical Association held at the New York College of Pharmacy Building, October 11th, 1915, called to order by President Lascoff at 8:40 p. m.

Upon motion the minutes of the May meeting were adopted as printed in the Journal of the A. Ph. A.

Upon motion the reading of the minutes of the special memorial meeting held in September was dispensed with and they were adopted.

The Treasurer's report was received with thanks.

Mr. McElhenie, member of the Council, reported asking for the opinion of the Branch as to how they wished him to vote on the question of Professor Diehl's proposed salary.

Dr. H. V. Army read a letter he had sent to Dr. H. M. Whelpley and stated that he believed that Prof. Diehl's many years of service to the Association merited this slight token. After considerable discussion favorable to the motion before the council, Mr. McElhenie was informed that the Branch favored the paying of the said salary.

Reports of Committees:

Membership—Absent.

Legislation and Education—Progress.

Progress of Pharmacy—Absent.

Reports of delegates to the annual meeting of the A. Ph. A. Former President Mayo presented a very interesting report on

the social activities of the San Francisco meeting.

Former President John C. Gallagher of the New Jersey Pharmaceutical Association reported on the meeting held at Spring Lake last June.

President Charles J. McCloskey of the N. J. Pharmaceutical Association was called upon by the Chair and supplemented Mr. Gallagher's remarks.

Professor Geo. C. Diekmann sent a letter regretting his absence and enclosed a detailed report of the New York State meeting, which was read by the secretary.

All the above reports were accepted with the thanks of the Branch.

A communication from President Lascoff, appointing the following as a Committee on Resolutions, was received: Messrs. Diner, Diekmann, Bigelow, Army, Lascoff, Weinstein and Hostmann.

Applications for membership were received from Dr. Philip Eichler and Mr. J. S. Potter and were ordered sent to the General Secretary.

Prof. Army then read a paper on "Standard Colored Fluids," which was illustrated with many interesting exhibits.

The paper was discussed by Messrs. Wimmer, Diner, Raubenheimer, Mayer and others, and was accepted with the thanks of the Branch.

A percolator for the manufacture of tincture of iodine was then exhibited. After some discussion the consensus of opinion was that it was not of any practical value.

President Lascoff then gave a very successful and interesting demonstration of his new "Capsule and Ampule Filler." This called for a very animated discussion taken part in by Messrs. Diner, Wimmer, Raubenheimer, Mayo and others.

The thanks of the Branch were extended to the President and the meeting then adjourned.

JEANNOT HOSTMANN, Secretary.

#### SAN FRANCISCO.

The San Francisco Branch of the American Pharmaceutical Association met on November the ninth in the office of the Pacific Pharmacist. Dr. A. Schneider, the president, presided. The minutes of the October meeting were read and approved.

A communication from Secretary Day was

read and the question of increasing the membership was put before the members. A wide-awake campaign will be commenced immediately for new members.

During the review of current pharmaceutical literature, extracts from the Journal of the American Medical Association, Mercks Report, the Druggists' Circular, Journal of the N. A. R. D., A. Ph. A. Journal and other valuable publications were given. Formulas for the preparation of castor oil in powder form and for cod liver oil jelly were discussed. Mention was also made of the Autolysin treatment for cancer, and it was said that this treatment offers nothing better than the older methods.

The affairs of the Branch will be in charge of the following newly elected officers: President, Joseph L. Lengfeld; Vice-President, Jennie Maguire White; Secretary-Treasurer, Clarissa M. Roehr. The December meeting will be held on the fourteenth, 723 Pacific Building.

CLARISSA M. ROEHR, Secretary.

#### NASHVILLE.

The regular meeting of the Nashville Branch A. Ph. A. was held in a joint session with the Nashville Drug Club in the Music Room of the Nashville Y. M. C. A., Thursday afternoon, Nov. 18th, with D. J. Kuhn presiding. After the minutes were read and approved, Congressman Joseph W. Byrns was introduced, who explained the provisions of the Stevens Bill and stated many good reasons why he thought the bill should be enacted. He said that most of the work of Congress was done by committees and that the passage of the bill depended largely on having it reported favorably by the committee to which it was referred.

Letters were read from Senator Luke Lea and ex-Governor M. R. Patterson, favoring the measure. The bill was then discussed at length by different members. The point was brought out that Senator Stevens, the author of the bill, had been defeated and that someone else would have to reintroduce it at the next session of Congress.

On motion of W. R. White, a resolution was passed requesting Congressman T. W. Sims to support the measure. Congressman Sims is a member of the Committee on Interstate and Foreign Commerce to which the bill was referred. Similar letters were or-

dered sent to all the other Tennessee Senators and Congressmen. Gus A. Blodou was instructed to prepare a friendly reply to the North Nashville Medical Society in answer to a communication received from them criticizing local druggists.

A paper reviewing the current drug journals was read by Dr. J. O. Burge.

The question of prescription prices was then discussed, after which the Branch adjourned.

WILLIAM R. WHITE, Secretary.

### NORTHWESTERN BRANCH.

The first 1915 Fall meeting of the Northwestern Branch of the American Pharmaceutical Association was held at the Nicollet Hotel, Minneapolis, on Friday evening, Oct. 22nd. The business meeting and program for the evening were preceded by a dinner beginning at 7 p. m. Under the heading of new business, the secretary offered a motion providing for the endorsement by the Branch of the Stevens Bill and the principles contained therein. The motion received a second by Mr. Chas. H. Huhn and was unanimously carried.

Letters of regret at inability to be present at the meeting were read as received from R. J. Messing, President of the Minnesota State Pharm. Association; William Abbett of Duluth and Max Menzel of Pipestone, Minn.

After the brief business meeting, the following program was carried out:

1. How a Pharmacopoeia Is Revised, by Prof. H. M. Whelpley, Dean of the St. Louis College of Pharmacy and Treasurer of the American Pharmaceutical Association.
2. The National Association of Boards of Pharmacy, by Mr. H. W. Rietzke, President of the Minnesota State Board of Pharmacy.
3. The American Conference of Pharmaceutical Faculties, by Dean F. J. Wulling.
4. A Further Report of the Study of Spirit of Nitrous Ether, by Prof. Gustav Bachman.
5. Recent Judicial Opinions on the Harrison Anti-Narcotic Law. Discussion by Messrs. Huhn, F. A. U. Smith, Tupper, Wulling, Morland, Frost and others.
6. The San Francisco Pharmaceutical Meetings. An Incompatible Prescription. Drugs Produced in Minnesota in 1915, by E. L. Newcomb.

H. M. Whelpley, Dean of the St. Louis College, as a member of the Board of Trustees of the U. S. Pharmacopoeial Revision Committee, spoke at length and in detail on how the U. S. Pharmacopoeia is revised. The several headings in the following outline were well covered by the speaker:

The Pharmacopoeia Far-Reaching; Pharmacopoeia Defined; Early Pharmacopoeial Revision Work; Recent Pharmacopoeial Revision Work; Influence of the Food and Drugs Act; Medical Influence on the Pharmacopoeia; Why Pharmacists Have Not Deserted the U. S. P.; The Scope of the U. S. P.; Legal Status of the U. S. P.; Work of a Pharmacopoeial Convention; and How the Committee on Revision Works.

Dean H. M. Whelpley of the St. Louis College of Pharmacy examining specimens of the root systems of *Rheum palmatum* and *Rheum officinale* in the Medicinal Plant Laboratory of the College of Pharmacy of the University of Minnesota. Photograph through courtesy of Professor E. L. Newcomb.

The work of the Committee on Revision goes on so quietly that no one realizes the nature or full extent of the task. The General Committee consists of fifty-one members who work without salary or assurance of adequate remuneration. This large body finally passes on all questions brought before it and must approve the Pharmacopoeia as a whole before the pages are electrotyped for printing. Each of the fifty-one members has

a large ring cover in which to file the recent correspondence. The letters are mimeographed on legal cap size sheets. The pages are numbered consecutively and the letters dated and numbered. Canvas binders are furnished, each holding five hundred sheets of the accumulated correspondence. Thus each member has a complete set of volumes covering all the work of the General Committee. The last circular is numbered 326, dated October 16, 1915, and closes with page 1876. This means that 95,676 sheets like this exhibit were mimeographed and mailed to fifty-one members of the General Committee on Revision. The General Committee is divided into fifteen sub-committees on different subjects. Each one of the smaller committees has a chairman who conducts correspondence with the associates on his committee. Each member of a sub-committee has a full set of all the correspondence of the committee. As some persons serve on two or more committees, this correspondence becomes very voluminous. The Executive Committee of fifteen receives the reports of sub-committees and votes on them before subjects go to the General Committee for approval. The last Executive Committee letter is Number 651 and is on page 3358, October 9, 1915. These are mimeographed on letter size sheets. The Executive Committee has to date required a total of 52,370 sheets. This, together with the General Committee sheets, makes a total of 148,046 sheets to date. As sheets of both circulars and letters in addition to the above are sent to five trustees, we must add 28,170 sheets, making a grand total of 176,216 sheets exclusive of the over run for reserve sets. It is probable that at least 200,000 sheets have been mimeographed to date, including the work of mimeographing and mailing, we can allow one minute's time for each sheet. This is the equivalent of 3,333 hours, or 116 days of eight hours each. This makes no allowance whatever for the work of individual members of the committee in studying, experimenting and commenting on the information contained in these sheets. This statement of mechanical labor will give some idea of the mental work which has thus far been recorded. It is merely the summing up of the committee work, which in turn is based on the work of individual pharmacists, the world over. The pharmacopoeial work of the

American pharmacists is, indeed, the great work of the pharmacists of this decade. Subjects of interest are:

Digest of Comments on the U. S. P.; Board of Trustees of the U. S. P. Convention; The Sale of the Pharmacopoeia; Spanish Translation of the U. S. P.; Payment for Use of U. S. P. Text; Authority to Use for Comment; Pharmacopoeial Income; Pharmacopoeial Expenses; Honoraria for Pharmacopoeial Work; The Chairman of the Committee on Revision; Proof Reading on the Pharmacopoeia; U. S. P. Publicity; The New Pharmacopoeia; How the Pharmacopoeia Should Be Revised.

\*After the address by Dean Whelpley, Mr. Rietzke referred to the organization of the National Association of Boards of Pharmacy, its function and usefulness, and explained the methods employed by the Minnesota Board for granting reciprocal registration.

Dean Wulling spoke briefly concerning the intimate relationship between the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties.

Prof. Bachman presented in tabulated form a detailed report of the rapidity of deterioration in spirit of nitrous ether, which had been kept under varying conditions. The table elicited a lively discussion in which the following took part: Messrs. Rietzke, Wulling, Friedman, Newcomb, and Dr. Rock.

Mr. Chas. H. Huhn opened the discussion on recent judicial opinions on the Harrison Anti-Narcotic Law. The discussion was continued by Messrs. Morland, Tupper, Kline, Griffin, Von Rohr and Goodrich. In closing, Mr. Huhn stated that if there was a loophole in the Harrison Anti-Narcotic Law, the National Association of Retail Druggists would exert every effort possible to have the law amended or so changed that the effect of the law would be as desired by the pharmacists.

Dr. Newcomb in referring to the San Francisco Pharmaceutical meetings, directed the attention of the members to the reports in the pharmaceutical journals and called particular attention to the large number and variety of papers which were presented in San Francisco. He also called attention to a prescription which called for Tincture of Iodine, Ammonia Water and Collodion in equal parts, stating that the mixture was in-

\* Dean Whelpley's address proved most interesting and instructive, especially to those who have not had actual experience in the revision of the Pharmacopoeia. A vote of thanks was tendered Dean Whelpley for presenting the instructive paper.

compatible, on account of the stronger ammonia water being an aqueous preparation, which gives a precipitate of cellulose from the collodion, and that physicians who desire to use this preparation should prescribe the Spirit of Ammonia, which being an alcoholic preparation, is compatible with Collodion.

About 20 specimens of drugs produced from medicinal plants grown in the medicinal plant garden of the College of Pharmacy of the University of Minnesota during 1915 were exhibited by Dr. Newcomb. Special attention was called to a specimen of the root system *Rheum Officinale*, which showed the large rhizomes from which *Shensi Rhubarb* is prepared. Among the specimens exhibited were *Belladonnae Folia*, *Hyoscyamus*, *Stramonium*, *Cannabis sativa*, *Phytolacca*, *Marubium*, *Chenopodium*, *Belladonnae Radix*, *Inula*, *Digitalis* and *Datura tatula*, the leaves of which will be official in the U. S. P. IX.

In closing, Dr. Newcomb called attention to the use of Powdered *Abrus* in the treatment of the advanced stages of trachoma. A specimen of whole *Abrus* or Jequirity seed was exhibited, and the toxic nature of the drug referred to. Recent prescriptions in the Northwest have called for *Abrus* in the form of a fine powder. The speaker also stated that the drug was sometimes used in the form of a 4 percent infusion, prepared with normal salt solution. The use of *Abrus* was further discussed by Mr. Morland, who referred to the use of the drug in Europe.

Among those outside of the Twin Cities who attended the meeting should be mentioned Mr. Robert Morland of Worthington, Minn.; Mr. Arthur VonRohr of Winona, Minn.; and Mr. George H. Goodrich of Anoka, Minn.

A total number of about 60 were present.

E. L. NEWCOMB, Secretary.

### WEST VIRGINIA.

The West Virginia Branch of the A. Ph. A. met Friday evening, November 5th, at Woodburn Hall, West Virginia University, and was called to order by President W. A. Ream. The following gentlemen were appointed to the Committee on Pharmaceutical Education: C. A. Neptune of Parkersburg and W. H. Moore and A. B. Berry of Morgantown.

Professor C. H. Rogers read a very inter-

esting paper on "Fakes," giving the results of analyses of a number of the most prominent ones.

Mr. Jackman gave a talk on "Scale Salts of Iron." Mr. Jackman showed a thorough knowledge of the subject.

A feeling of good fellowship pervades these meetings and they are thoroughly enjoyed by all.

A. B. BERRY, Secretary.

### PHILADELPHIA.

The regular monthly meeting of the Philadelphia Branch of the American Pharmaceutical Association was held Tuesday night, November 9th, at the Temple College of Pharmacy.

President Henry called the meeting to order at 8:15 o'clock and the minutes of the last meeting were read and approved. There being no new or unfinished business, the program of the evening was taken up.

John K. Thum, Ph.G., presented "A Review of Pharmaceutical Literature."

Prof. Charles E. Vanderkleed gave a very interesting account of his experience in "Europe in War Times."

The remainder of the evening was devoted to a spirited discussion of the subject, "Is Tetanus Caused by Vaccination?"

Dr. F. E. Stewart read a paper on the subject and his view that tetanus is not caused by vaccination was upheld by Dr. Wadsworth and Dr. J. F. Schamberg, but was rather violently opposed by C. Oscar Beasley, President of the Pennsylvania Anti-Compulsory Vaccination Society.

J. ED. BREWER, Secretary.

### CITY OF WASHINGTON.

The initial meeting of the City of Washington Branch of the American Pharmaceutical Association, 1915-16, was held Wednesday, October 27, 1915, at the National College of Pharmacy. The attendance was fair and the subjects for discussion were the annual meeting of the A. Ph. A., by Professor Henry P. Hynson, Baltimore; and the annual meeting of the N. A. R. D., by Mr. J. Leyden White.

Mr. Hynson presented his subject in a very humorous manner and created much amusement telling anecdotes incident to the trip and meeting. He recalled that everything

good of a pharmaceutical nature had been started by the A. Ph. A.; that this was true of the San Francisco meeting in the work accomplished in harmonizing the schools and boards, resulting in a closer relationship between the American Conference of Pharmaceutical Faculties, National Association of Boards of Pharmacy and the American Pharmaceutical Association. The determination to work for pre-requisite requirements and four years of high school education by 1920 seemed to be satisfactory to all interests.

The report of the Commission on Proprietaries was in his judgment the best piece of work that had been started in years by the A. Ph. A., and was more than commendable. He suggested that a coalition of all pharmaceutical bodies would be desirable and should be established under the auspices of the A. Ph. A. He pointed out that the membership had fallen to about 3,000, that the Council was too large to transact business satisfactorily, and that the financial condition of the organization was not the best at the present. In his judgment the establishing of higher educational qualifications would result in the elimination of unendowed teaching institutions, unless those interested would work to bring about assistance from the State and this could be done on the grounds of public safety. Mr. Hoyer's paper showing the profit on the prescription end of the business was worthy of careful study, as it showed from reliable statistics that this part of the business amounted to about 13 percent net profit, going to show a good reason for more commercialism in pharmacy these days.

Mr. J. Leyden White was unable to be present and his paper was presented by the Secretary. He pointed out a satisfactory financial condition of the N. A. R. D. due principally to the income from its Journal. The all-absorbing issue of this convention was the question of standardization of selling prices and the endorsement of the Stevens bill. This measure, in its broadest sense, was so constantly in evidence at the convention as to represent the chief reason for the existence of the Association. The Association reaffirmed and vigorously declared its determination to preserve the identity of the drug store as a pharmacy. Propaganda movement failed to show any great advancement. It was, however, decided to continue this work. The Harrison narcotic law was a feature

and while some dissatisfaction existed with reference to T. D. 2213, they were unanimously of the opinion that much more had been accomplished in a few months than was ever expected. The creation of a Committee on Postal Affairs was an innovation that should bring about much good. The relation of liquor to the drug store was discussed and the conclusion reached that it had its place in pharmacy, (this was questioned by the members present) and that nothing could be done at present nor until internal revenue laws were amended, and that house-cleaning, if any were needed, would have to be deferred.

Both papers elicited much discussion that was entered into by all members present. Some of the facts brought out by Mr. Hynson resulted in the following resolutions being presented by the Secretary:

WHEREAS, The Council of the American Pharmaceutical Association has very profitably and wisely largely grown in the number of its members and has become a desirable and effective working body at the annual meetings; and

WHEREAS, A Council of this size can not be maintained and its business properly transacted by mail; therefore,

*Be it resolved*, That it is the sense of the Local Branch of the American Pharmaceutical Association of Washington, D. C., that the Council should be authorized to elect three members, who, together with the Chairman and the Secretary of the Council, shall constitute an executive committee, this committee to be empowered to carry on the business of the Association as mapped out at its annual meeting during the intervals of the said annual meetings. A resolution was also presented relating to the finances of the Association and providing for a special committee. (This is now being considered by the Council.)

After discussing same, both resolutions were unanimously approved and the Secretary directed to forward them to the Secretary of the Council.

The Secretary presented a communication received from the Deputy Commissioner of Internal Revenue, relative to T. D. 2241, authorizing the use of formula No. 19, equal parts of ethyl alcohol and ether, and providing this special denatured alcohol for use in the manufacture of Collodion. This com-

munication was most interesting, in view of the fact that the department holds that collodion is a varnish and not a medical preparation and that the use of this special denatured alcohol in the manufacture of collodion is permissible *only* where the collodion is entirely free from medicinal properties.

S. L. HILTON, Secretary.

<>

#### BALTIMORE.

Minutes of the November meeting of the Baltimore Branch of the American Pharmaceutical Association, held Wednesday, November 17th, at 8 p. m. The notice of the meeting read: Of the three important events scheduled for this month, one happened on the Tuesday after the first Monday, one is to occur on the Wednesday after the third Tuesday, and the other is to be celebrated on the Thursday after the last Wednesday. All of us who could, should have exercised, and it is to be hoped, that in the near future, some of us who couldn't will exercise the suffrage on the first of these three happenings. All of us can and, we are sure, will, enter at least privately, if not publicly, into the spirit of the last of these celebrations. All of us ought to be present at the occurrence between the first and last of these events and help make this another good meeting of the Branch. We are to have with us Dr. Herman Engelhardt, who was the Chairman of the Scientific Section of the American Pharmaceutical Association, and he is to review the work of this Section.

#### THE JOURNALS.

Six of the Journals have been assigned to as many different members, and we are to have presented, for our information and discussion, one or more articles from each.

Dig out something interesting from your Journal, bring it along and discuss it with us.

The Secretary has promised, if time permits, to tap his Odoriferously Historical Eight-barreled-mothball-sale paper for our amusement if not for our edification.

A paper by Dr. Engelhardt was presented in which he reviewed the work of the Scientific Section of the parent association, and the part which caused most discussion was that which considered Professor Scoville's paper on "Tinctures."

Professor Scoville had carried out experi-

ments covering a period of four years in order to find out whether or not tinctures made from fluidextracts were just as effective and stable as those prepared by the U. S. P. processes, and his conclusion was: "On the whole, tinctures made from fluid extracts compare very favorably with those made direct from the drugs; in the case of the standardized tinctures, the strength is necessarily the same and the stability is fully as good, if not better." The inference as to non-standardized of course being that, as those which could be subjected to chemical and physiological tests were all right, the others must be.

In the discussion it was brought out that one pharmacy of an exceedingly high reputation possibly owed considerable of its success to the uniformity and reliability of its tinctures, which were made from assayed fluidextracts wherever possible, and this method was contrasted with the practice of some pharmacists dispensing unassayed tinctures made from assayed and even unassayed drugs which might or might not represent the proper strength.

The absurdity of the Pharmacopœia directing that tincture of nux vomica be made from a powdered extract when it already recognized an assayed fluid extract, was pointed out.

In this connection, however, it was emphasized that infusions and decoctions must never be made from fluid extracts as the menstruum used was entirely different.

The final clearing up of the difference of opinion between the Branch and one of the Journals by the latter conceding the non-solubility in oils as well as non-miscibility of ichthylol with oils by the Journal publishing a paper on the subject, which was the result of the Branch's activities, brought out, that the proper way in which to incorporate ichthylol with fats in ointments was to spread a thin film of the fat over considerable of the surface of the ointment slab and to place the ichthylol on this, add the rest of the fat and incorporate immediately. Any portion of ichthylol allowed to stick to the slab or exposed unprotected for even a short while to the air was likely to dry out hard and form specks which would not rub out and which would make the ointment unsightly.

Along the line of solubility, the sparing

solubility of phosphorus in chloroform was discussed and the pharmacopeia was criticised for directing phosphorus to be so dissolved in making pills of phosphorus.

With great difficulty it is soluble in chloroform and it was suggested that the best form in which to incorporate it into pills is by using phosphorized resin.

The formation of the poisonous quinotoxin in long-standing combinations of aspirin and quinine salts was considered and the statement was made that a pharmaceutical house had put out thousands of boxes of compressed tablets containing among other ingredients these two chemicals, and had been putting them up for years and not a single case of bad symptoms had been reported. The well-known idiosyncrasy of some persons to quinine was cited as possibly being the cause of the reported bad effects.

The ruling of the Bureau of Chemistry that a drachm is the one-sixteenth of an avoirdupois ounce was thought unfortunate as reviving an obsolete weight and the sense of the meeting was that it ought to be reconsidered and the apothecary's drachm, or sixty grains, be declared official.

Mr. Meyer presented a prescription calling for: Copaiba, 4 drachms; balsam peru, 2 drachms; oil of turpentine, 2 drachms, and syrup of lemon sufficient to make 6 ounces.

Several different ways of mixing this were tried and each seemed a little worse than the other. The balsam peru being the disturbing factor. Several took down the formula and are to report at the next meeting as to their success or lack of it.

In commenting on the new Pharmacopeia it was pointed out that there will be many changes in it and it will be almost necessary

for pharmacists to go to school again and that already classes were being formed in other cities to learn of the changes and to become familiar with them, and, with this end in view, the Executive Committee was instructed to endeavor to arrange for a series of lectures on the new U. S. P. to be given by Dr. Caspari and to be under the auspices of the Branch.

The Executive Committee was instructed to confer with the proper committee from the Retail Druggists' Association in an effort to hold a joint meeting with them in December, at which the assistant advertising manager of one of the local papers was to be the principal speaker. The subject was to be along the lines of "Drug Store Advertising" and the idea was the outcome of a somewhat similar topic along other lines in which the advertising of proprietary preparations was considered.

A committee consisting of Miss Patterson, Mr. Lowry, Mr. Meyer and Mr. Neal was appointed to work out a different form of organization or to effect a readjustment along the lines of a compact body, the membership of which was to be small but thoroughly active and alive and that on special occasions the entire pharmaceutical interests could be invited to attend and at the regular meetings would be welcome, but that the notices of the latter would be sent only to the actual active membership.

As the hour was so late, adjournment was made and the Secretary did not read his paper on Moth-ball Sales, and, as it was along the line of advertising, it could better be considered at the next meeting.

WM. J. LOWRY, JR., Secretary.

---

I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the seashore, and diverting myself in now and then finding a smoother pebble, or a prettier shell than ordinary whilst the great ocean of truth lay all undiscovered before me.—*Isaac Newton*.

## The Pharmacist and the Law

### DENATURED ALCOHOL PERMISSIBLE IN MAKING NON-MEDICATED COLLODION.

Mr. S. L. Hilton has sent us the following which is a copy of a reply to his letter and is quoted in part. The specially denatured alcohol is made by mixing equal parts of ethyl alcohol and ethyl ether:

I have made a careful examination of the letter from S. L. Hilton, Washington, D. C., dated the 11th instant, relative to T. D. 2241, authorizing the use of denatured alcohol in the manufacture of U. S. P. Collodion. He makes three points in his argument as to why this T. D. should be revoked:

- 1st: That collodion is a medicine.
- 2nd: That collodion is mixed with other medicinal agents and that these compounds are medicinal.
- 3rd: That retail druggists in certain cases have the habit of making collodion and by reason of T. D. 2241, and the inability to obtain specially denatured alcohol, they would be unable to compete with larger manufacturers.

I think point No. 3 is immaterial to this office as it is simply an economic discussion.

In regard to point No. 1, I would quote from Wood's Therapeutics, page 630:

"Collodion—This is a solution in alcohol and ether of pyroxylin or soluble gun-cotton, which consists chiefly of the tri- and tetranitro-cellulose; upon evaporation collodion leaves on the skin an adherent protecting film. Physiologically, *gun-cotton is inert*."

It would, therefore, seem according to Wood that Collodion is not a medicine.

In regard to point No. 2, I would state that undoubtedly when collodion is mixed with iodine and other true medicinal agents some medicinal action would be exerted upon the human skin, therefore, there might be some question as to whether collodion manufactured from denatured alcohol should be used in such a preparation. However, since such preparations are only applied externally and before the effect is obtained the

denatured alcohol is all evaporated. I would think it a very narrow construction of the law to revoke the permission in this instance.

As stated above I believe that there is no question but what U. S. P. collodion is not in any sense a remedy or medicinal preparation.

Respectfully,

(Signed) A. B. ADAMS,

Chief Chemist.

### AMENDMENTS TO NEW YORK HEALTH BOARD MEDICINE REGISTRATION ORDINANCE.

The New York Health Board has amended the Medicine Registration Ordinance so that the third paragraph of Section 117 now reads:

The expression "proprietary or patent medicine," for the purposes of this section, shall be taken to mean and include every medicine or medical compound, manufactured, prepared or intended for internal human use, the name, composition or definition of which is not to be found in the United States Pharmacopoeia or National Formulary, or which does not bear the names of all the ingredients to which the therapeutic effects claimed are attributed and the names of all other ingredients except such as are physiologically inactive, conspicuously, clearly and legibly set forth, in English, on the outside of each bottle, box or package in which the said medicine or medicinal compound is held, offered for sale, sold or given away.

Subdivision e of Section 116, relating to misbranding reads:

(e) If any proprietary or patent medicine to which the provisions of sections 117 of this Code relate shall fail to contain every ingredient the name of which shall have been filed in the Department of Health, pursuant to section 117 of this code as a constituent part of said medicine, or if such proprietary or patent medicine shall contain any ingredient the name of which is required by the provisions of section 117 of this code to be filed in the said department which name has not been so filed. (S. C. Sec. 69.) (The provisions of subdivision (e) shall take effect December 31, 1915.)

# PROPRIETARY MEDICINE MEN TO FIGHT NEW YORK FORMULA DIS- CLOSURE ORDINANCE.

Characterizing the adoption of the proprietary medicine formula disclosure and registration ordinance of the New York City Health Board as "an arrogant assumption of a power which is non-existent in that board," members of the Proprietary Association of America voted as a body, at a special meeting, held in the Hotel Astor, New York City, on November 16 and 17, to ignore the provisions of section 117 of the local Sanitary Code, embodying this ordinance. The association also voted to offer legal and financial aid in the defense of any and all distributors of their goods who may be subjected to prosecution by the local health department for handling medicinal preparations which have not complied with the provisions of the ordinance by filing their qualitative formulas and registering with the Health Department authorities after December 31, when this ordinance becomes operative.

It was also voted at this meeting to safeguard the interests of the proprietary medicine industry against such emergency revenue taxation as that which has been levied upon perfumes and cosmetics through the stamp tax which became effective December 1 of last year and which Congress may attempt to continue through a re-enactment of Schedule "B" of the Emergency Revenue Act, after December 31 of this year.—From Paint, Oil and Drug Reporter.

## WAR DEPARTMENT

List of changes of stations covering period ending October 31, 1915, in the cases of Sergeants First Class, and Sergeants Hospital Corps.

### SERGEANTS FIRST CLASS.

Richard A. Wood, from on furlough in the U. S., to Frankford Arsenal.

Paul M. Lange, from Ft. Clark, to the Philippines Department.

Eugene Weber, from Ft. Barry, to ordered to the Philippines Department.

Fred O. Wells, from Ambulance Company No. 3, to the Philippines Department.

Richard T. Edwards, from the 13th Cavalry Hospital, at Columbus, N. M., to the Philippines Department.

Maynard Heatherly, from the 6th Cavalry Hospital, Southern Department, to the Philippines Department.

Charles M. Shaw, from Ambulance Company No. 5, to Ft. Porter.

Julius Strauss, from Rock Island Arsenal, ordered to Ft. Omaha.

Elmer H. Simons, from the Office of the Surgeon, Port of Embarkation, to Rock Island Arsenal.

John L. Collins, from Field Hospital Company No. 1, to the Philippines Department.

John Hodgins, from Ft. Monroe, to Ft. Michie.

Hans Hoch, from the 17th Infantry Hospital, Eagle Pass, Texas, to Ft. Washington.

John Keralla, from Ft. Washington, to Ft. Wood.

Christopher Killikelly, from Ft. Wood, to Field Hospital Company No. 6.

Charles G. Manning, from Ft. George Wright, to Ft. Apache.

Max Dohle, from Ambulance Company No. 2, to the Philippines Department (ordered).

George J. Shull, from Ft. Thomas, to the Philippines Department (ordered).

Henry Aicklen, from Field Hospital Company No. 3, to the Philippines Department (ordered).

Charles R. Bartlett, from Ft. Worden, to the Philippines Department (ordered).

William F. Coleman, from the Cantonment Hospital, Galveston, Tex., to the Philippines Department (ordered).

Frederick Thomas, from Ft. Crockett, to the Philippines Department (ordered).

### SERGEANTS.

William J. Maney, from Ft. Jay, to Ft. Totten.

Joseph Levy, from Plattsburg Barracks, to Ft. Jay.

Robert D. McElrath, from Ft. Yellowstone, to Ft. Bliss.

Arthur Bade, from Ft. Totten, to Ft. McKinley.

Edward H. Krog, from Key West Barracks, to Plattsburg Barracks.

Charles W. Jensen, from the Cable Boat "Joseph Henry," to the Organized Militia of Rhode Island.

George C. Daily, from Ft. Sam Houston, to Ft. Sheridan.

James F. Griffin, from the Philippines Department, to the Letterman General Hospital.

Rex M. Davenport, from Ft. Oglethorpe to Ft. Barrancas.

Everett E. Maddison, from Field Hospital Company No. 3, to ordered to the Philippines Department.

Richard Bennett, from Ft. Totten, to San Juan, P. R.

Andrew J. Billings, from the 2nd Division, Texas City, Texas, to Ft. Sheridan.

### Changes of Address

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of change of address is received before shipment or mailing.

Both the old and the new address should be given, thus:

HENRY MILTON,  
From 2342 Albion Place, St. Louis, Mo.  
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or type-written.

FLAKE, W. L.  
From residence unknown  
To Water Valley, Miss., (former address.)

BROMME, WM. L.  
From E. Kalispell, Mont.  
To Anamoose, N. D.

METZGER, ARTHUR S.  
From Cairo, Ill.  
To Malden, Mo.

HAESSLER, L. M.  
From 1960 W. Madison St., Chicago, Ill.  
To 1947 W. Madison St., Chicago, Ill.

STORER, C. A.  
From Cor. Rush & Ohio Sts. Chicago, Ill.  
To 4105 Kenmore Ave., Chicago, Ill.

TUPPER, E. A.  
From 800 Tenth St., Minneapolis, Minn.  
To Chicago and Tenth Sts., Minneapolis, Minn.

PORRO, ALVARO.  
From 17 San Francisco, Camaguey, Cuba.  
To Marti 23, Camaguey, Cuba.

DAVENPORT, J. S.  
From residence unknown  
To 6 F. A., Douglas, Ariz.

DIETZ, HENRY W.  
From residence unknown  
To U. S. A. Transport Merritt, Manila, P. I.

FENDER, WALTER E.  
From residence unknown  
To Ft. Monroe, Va.

HARDENBROOK, BURTON.  
From residence unknown  
To Ft. Missoula, Missoula, Mont.

LEWIS, WALTER.  
From Ft. Sherman, Cristobal, Canal Zone.

MARCUS, SAMUEL.  
From residence unknown  
To Ft. Ward, Wash.

MCENROE, ROBT. L.  
From residence unknown  
To Ft. Sam Houston, Texas.

TANNEY, LEWIS.  
From residence unknown  
To F. H. Co. 2, Presidio, San Francisco, Cal.

WAITZ, AUGUST H.  
From residence unknown  
To Ft. Flager, Wash.

BERNHARD, MAGNUS.  
From residence unknown  
To Syracuse, N. Y.

KISHON, ADOLPH M.  
From residence unknown  
To 417 Flower St., Los Angeles, Cal.

### BADGES AND BARS

Members who desire the official badges and bars for the meetings they may have attended are invited to correspond with the General Secretary. He is able to furnish from his stock the bars for the following meetings:

Asheville, 1894; Denver, 1895; Montreal, 1896; Lake Minnetonka, 1897; Put-in-Bay, 1899; St. Louis, 1901; Atlantic City, 1905; Hot Springs, 1908; Richmond, 1910; Denver, 1912; Nashville, 1913; Detroit, 1914; San Francisco, 1915.

The badge sells for \$2.00, and the bars at 75 cents each, beginning with 1899, those of prior meetings at 60 cents. Bars for meetings not mentioned may be made to order.

Address, W. B. Day, General Secretary, 74 East Twelfth street, Chicago.
